Target

Function

This protein may be involved in the regulation of B-cell activation and proliferation.

Tissue specificity

Expressed on B-cells.

Involvement in disease

Defects in MS4A1 are the cause of immunodeficiency common variable type 5 (CVID5) [MIM:613495]; also called antibody deficiency due to CD20 defect. CVID5 is a primary immunodeficiency characterized by antibody deficiency, hypogammaglobulinemia, recurrent bacterial infections and an inability to mount an antibody response to antigen. The defect results from a failure of B-cell differentiation and impaired secretion of immunoglobulins; the numbers of circulating B cells is usually in the normal range, but can be low.

Sequence similarities

Belongs to the MS4A family.

Post-translational modifications

Phosphorylated. Might be functionally regulated by protein kinase(s).

Cellular localization

Membrane.

Immunohistochemistry (Formalin/PFA-fixed paraffin-embedded sections)-Anti-CD20 antibody [EP459Y] - Carboxyterminal end(ab78237)

Immunohistochemical staining of paraffin embedded B cell lymphoma with purified ab78237 at a working dilution of 1/50. The secondary antibody used is [ab97051](#), a goat anti-rabbit IgG (H&L) at a dilution of 1/500. The sample is counter-stained with hematoxylin. Antigen retrieval was performed using Tris-EDTA buffer, pH 9.0. PBS was used instead of the primary antibody as the negative control, and is shown in the inset.
