Human Histone H3 (tri methyl K36) peptide ab1785

1 Image

Description						
Product name	Human Histone H3 (tri methyl K36) peptide					
Purity	> 90 % HPLC.					
Accession	<u>P68431</u>					
Animal free	No					
Nature	Synthetic					
Species	Human					
Modifications	tri methyl K37					
Specifications						
Our Abpromise quarantee	covers the use of ab1785 in the following tested applications.					
	e recommended starting dilutions; optimal dilutions/concentrations should be determined by the end user.					
Applications	Dot blot					
	Blocking - Blocking peptide for Anti-Histone H3 (tri methyl K36) antibody - ChIP Grade (ab9050					
Form	Liquid					
Additional notes	- First try to dissolve a small amount of peptide in either water or buffer. The more charged					
	residues on a peptide, the more soluble it is in aqueous solutions.					
	- If the peptide doesn't dissolve try an organic solvent e.g. DMSO, then dilute using water or					
	buffer.					
	- Consider that any solvent used must be compatible with your assay. If a peptide does not					
	dissolve and you need to recover it, lyophilise to remove the solvent.					
	 Gentle varming and sonication can effectively aid peptide solubilisation. If the solution is cloudy or has gelled the peptide may be in suspension rather than solubilised. 					
	- Peptides containing cysteine are easily oxidised, so should be prepared in solution just price					
	to use.					

Stability and Storage

Shipped at 4°C. Store at +4°C short term (1-2 weeks). Upon delivery aliquot. Store at -20°C or - 80°C. Avoid freeze / thaw cycle.

General Info

Function	Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin, limiting						
	DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.						
Sequence similarities	Belongs to the histone H3 family.						
Developmental stage	Expressed during S phase, then expression strongly decreases as cell division slows down during the process of differentiation.						
Post-translational modifications	Acetylation is generally linked to gene activation. Acetylation on Lys-10 (H3K9ac) impairs methylation at Arg-9 (H3R8me2s). Acetylation on Lys-19 (H3K18ac) and Lys-24 (H3K24ac) favors methylation at Arg-18 (H3R17me). Citrullination at Arg-9 (H3R8ci) and/or Arg-18 (H3R17ci) by PAD4 impairs methylation and represses transcription. Asymmetric dimethylation at Arg-9 (H3R8me2s) by PRMT5 is linked to gene repression. Asymmetric dimethylation at Arg-9 (H3R8me2s) by PRMT6 is linked to gene repression and is mutually exclusive with H3 Lys-5 (H3K7me2a) by PRMT6 is linked to gene repression and is mutually exclusive with H3 Lys-5 methylation (H3K4me2 and H3K4me3). H3R2me2a is present at the 3' of genes regardless of their transcription state and is enriched on inactive promoters, while it is absent on active promoters. Methylation at Lys-5 (H3K4me), Lys-37 (H3K36me) and Lys-80 (H3K79me) are linked to gene activation. Methylation at Lys-5 (H3K4me) facilitates subsequent acetylation of H3 and H4. Methylation at Lys-5 (H3K4me), Lys-37 (H3K36me) and Lys-80 (H3K79me) are linked to gene activation at Lys-5 (H3K4me) facilitates subsequent acetylation of H3 and H4. Methylation at Lys-80 (H3K79me) is a specific target for HP1 proteins (CBX1, CBX3 and CBX5) and prevents subsequent phosphorylation at Lys-80 (H3K79me) are linked to gene repression. Methylation at Lys-10 (H3K9me) and Lys-80 (H3K79me) and Lys-80 (H3K79me) are linked to gene repression. Methylation at Lys-10(H3K4me) and Lys-80 (H3K79me) and Lys-80 (H3K79me) are activation of H3 and H4. Methylation at Lys-10 (H3K9me) and Lys-80 (H3K79me) are activation of H3 and H4. Methylation at Lys-10 (H3K9me) and Lys-80 (H3K79me) and Lys-10 (H3K9me) and						

Phosphorylation at Tyr-42 (H3Y41ph) by JAK2 promotes exclusion of CBX5 (HP1 alpha) from chromatin.

Monoubiquitinated by RAG1 in lymphoid cells, monoubiquitination is required for V(D)J recombination (By similarity). Ubiquitinated by the CUL4-DDB-RBX1 complex in response to ultraviolet irradiation. This may weaken the interaction between histones and DNA and facilitate DNA accessibility to repair proteins.

Cellular localization

Nucleus. Chromosome.

ab1785 (at 0.01 and 0.1 μ g) used in dot blot to test for crossreactivity of <u>ab9050</u> (1/2500). An HRP-conjugated mouse antirabbit lgG polyclonal (1/10000) was used as the secondary antibody.

Dot Blot - Human Histone H3 (tri methyl K36)

peptide (ab1785)

Please note: All products are "FOR RESEARCH USE ONLY. NOT FOR USE IN DIAGNOSTIC PROCEDURES"

Our Abpromise to you: Quality guaranteed and expert technical support

- · Replacement or refund for products not performing as stated on the datasheet
- Valid for 12 months from date of delivery
- Response to your inquiry within 24 hours
- We provide support in Chinese, English, French, German, Japanese and Spanish
- Extensive multi-media technical resources to help you
- · We investigate all quality concerns to ensure our products perform to the highest standards

If the product does not perform as described on this datasheet, we will offer a refund or replacement. For full details of the Abpromise, please visit <u>https://www.abcam.com/abpromise</u> or contact our technical team.

Terms and conditions

• Guarantee only valid for products bought direct from Abcam or one of our authorized distributors
