General Info

Function	Binds to the receptor tyrosine kinases EPHB1 and EPHA1. Binds to, and induce the collapse of, commissural axons/growth cones in vitro. May play a role in constraining the orientation of longitudinally projecting axons.
Tissue specificity	Heart, placenta, lung, liver, skeletal muscle, kidney, pancreas.
Involvement in disease	Defects in EFNB1 are a cause of craniofrontonasal syndrome (CFNS) [MIM:304110]; also known as craniofrontonasal dysplasia (CFND). CFNS is an X-linked inherited syndrome characterized by hypertelorism, coronal synostosis with brachycephaly, downslanting palpebral fissures, clefting of the nasal tip, joint anomalies, longitudinally grooved fingernails and other digital anomalies.
Sequence similarities	Belongs to the ephrin family.
Post-translational modifications	Inducible phosphorylation of tyrosine residues in the cytoplasmic domain.
Cellular localization	Membrane.
