**Product datasheet**

**Anti-PAX6 antibody ab5790**

![22 Abreviews 68 References 6 Images](https://abcd.com/some-image-url)

### Overview

**Product name**  
Anti-PAX6 antibody

**Description**  
Rabbit polyclonal to PAX6

**Host species**  
Rabbit

**Specificity**  
This antibody does not detect bovine PAX6 by Western blot.

We have had mixed results for use of this antibody in IHC-Fr. Thus, we are removing IHC-Fr as a guaranteed application and welcome any feedback from customers who have used this antibody in IHC-Fr.

**Tested applications**  
Suitable for: IP, ICC/IF, WB

**Species reactivity**  
React with: Mouse, Rat, Sheep, Human

**Predicted to work with:** Chicken, Cow, Dog, Xenopus laevis, Non human primates, Zebrafish, Rhesus monkey

**Immunogen**  
Synthetic peptide corresponding to Mouse PAX6 aa 267-285.

Sequence: REEKLRNQRQRQASNTPSHI

Database link: P63015  
(Peptide available as ab5895)

### Properties

**Form**  
Liquid

**Storage instructions**  
Shipped at 4°C. Store at +4°C short term (1-2 weeks). Upon delivery aliquot. Store at -20°C or -80°C. Avoid freeze / thaw cycle.

**Storage buffer**  
Preservative: 0.05% Sodium azide  
 Constituents: 0.1% BSA, 99% PBS

**Purity**  
Immunogen affinity purified

**Primary antibody notes**  
PAX genes encode nuclear transcription factors which are regarded as major controllers of developmental processes in both vertebrates and invertebrates. Mutations in murine PAX genes underlie three natural mouse alleles and several corresponding human syndromes (aniridia, foveal hypoplasia and Peters’ anomaly). Murine PAX genes have been shown to be proto-oncogenes.
Furthermore, human PAX genes have recently been demonstrated to play an influential part in some common human cancers such as brain tumors and lymphomas. All PAX genes encode a DNA-binding domain termed the paired domain and in addition some also encode a second binding domain—the paired type homeobox. PAX6 is involved in the early development of the optical vesicle and has been shown to interact with Six3, another important visual development protein.

Clonality: Polyclonal
Isotype: IgG

Applications

Our Abpromise guarantee covers the use of ab5790 in the following tested applications. The application notes include recommended starting dilutions; optimal dilutions/concentrations should be determined by the end user.

Target

Function

Transcription factor with important functions in the development of the eye, nose, central nervous system and pancreas. Required for the differentiation of pancreatic islet alpha cells (By similarity). Competes with PAX4 in binding to a common element in the glucagon, insulin and somatostatin promoters. Regulates specification of the ventral neuron subtypes by establishing the correct progenitor domains (By similarity). Isoform 5a appears to function as a molecular switch that specifies target genes.

Tissue specificity

Fetal eye, brain, spinal cord and olfactory epithelium. Isoform 5a is less abundant than the PAX6 shorter form.

Involvement in disease

Defects in PAX6 are the cause of aniridia (AN) [MIM:106210]. A congenital, bilateral, panocular disorder characterized by complete absence of the iris or extreme iris hypoplasia. Aniridia is not just an isolated defect in iris development but it is associated with macular and optic nerve hypoplasia, cataract, corneal changes, nystagmus. Visual acuity is generally low but is unrelated to the degree of iris hypoplasia. Glaucoma is a secondary problem causing additional visual loss over time.

Defects in PAX6 are a cause of Peters anomaly (PAN) [MIM:604229]. Peters anomaly consists of a central corneal leukoma, absence of the posterior corneal stroma and Descemet membrane, and a variable degree of iris and lenticular attachments to the central aspect of the posterior cornea.

Defects in PAX6 are a cause of foveal hypoplasia (FOVHYP) [MIM:136520]. Foveal hypoplasia can be isolated or associated with presenile cataract. Inheritance is autosomal dominant.

Defects in PAX6 are a cause of keratitis hereditary (KERH) [MIM:148190]. An ocular disorder characterized by corneal opacification, recurrent stromal keratitis and vascularization.
Defects in PAX6 are a cause of coloboma ocular (COLO) [MIM:120200]; also known as uveoretinal coloboma or coloboma of iris, choroid and retina. Ocular colobomas are a set of malformations resulting from abnormal morphogenesis of the optic cup and stalk, and the fusion of the fetal fissure (optic fissure). Severe colobomatous malformations may cause as much as 10% of the childhood blindness. The clinical presentation of ocular coloboma is variable. Some individuals may present with minimal defects in the anterior iris leaf without other ocular defects. More complex malformations create a combination of iris, uveoretinal and/or optic nerve defects without or with microphthalmia or even anophthalmia.

Defects in PAX6 are a cause of coloboma of optic nerve (COLON) [MIM:120430].

Defects in PAX6 are a cause of bilateral optic nerve hypoplasia (BONH) [MIM:165550]; also known as bilateral optic nerve aplasia. A congenital anomaly in which the optic disc appears abnormally small. It may be an isolated finding or part of a spectrum of anatomic and functional abnormalities that includes partial or complete agenesis of the septum pellucidum, other midline brain defects, cerebral anomalies, pituitary dysfunction, and structural abnormalities of the pituitary.

Defects in PAX6 are a cause of aniridia cerebellar ataxia and mental deficiency (ACAMD) [MIM:206700]; also known as Gillespie syndrome. A rare condition consisting of partial rudimentary iris, cerebellar impairment of the ability to perform coordinated voluntary movements, and mental retardation.

**Sequence similarities**

Belongs to the paired homeobox family.
Contains 1 homeobox DNA-binding domain.
Contains 1 paired domain.

**Developmental stage**

Expressed in the developing eye and brain.

**Post-translational modifications**

Ubiquitinated by TRIM11, leading to ubiquitination and proteasomal degradation.

**Cellular localization**

Nucleus.

**Immunofluorescent analysis of PAX6 (green) in All-Trans-Retinoic Acid (ATRA) treated (10 µM for 24 hours) NCCIT cells. Formalin fixed cells were permeabilized with 0.1% Triton X-100 in TBS for 10 minutes at room temperature and blocked with 1% BSA for 15 minutes at room temperature. Cells were probed with a PAX6 polyclonal antibody(ab5790) at a dilution of 1:50 for at least 1 hour at room temperature and incubated with DyLight 488 goat-anti-rabbit IgG secondary antibody at a dilution of 1:400 for 30 minutes at room temperature. F-Actin (red) was stained with DyLight 554 Phalloidin and nuclei (blue) were stained with Hoechst 33342 dye. Images were taken at 20X magnification.**
Western blot analysis of PAX6 was performed by loading 50µg of various Human, mouse and non-human primate whole cell lysates per well onto a 4-20% Tris-HCl polyacrylamide gel. Proteins were transferred to a PVDF membrane and blocked with 5% BSA/TBST for at least 1 hour. The membrane was probed with a PAX6 polyclonal antibody (ab5790) at a dilution of 1:1000 overnight at 4°C on a rocking platform then washed in TBS-0.1% Tween 20 and probed with a goat anti-rabbit IgG-HRP secondary antibody at a dilution of 1:20000 for at least one hour. Chemiluminescent detection was performed.

Immunoprecipitation of PAX6 was performed on 293T cells. Antigen: antibody complexes were formed by incubating 500 µg whole cell lysate with 5 µg of PAX6 polyclonal antibody (ab5790) overnight on a rocking platform at 4°C. The immune complexes were captured on 50 µl Protein A/G Agarose, washed extensively and eluted with 5X Buffer. Samples were resolved on a 4-20% Tris-HCl polyacrylamide gel then transferred to a PVDF membrane and blocked with 5% BSA/TBS-0.1% Tween for at least 1 hour. The membrane was probed with a PAX6 monoclonal antibody at a dilution of 1:1000 overnight rotating at 4°C then washed in TBST and probed with detection reagent at a dilution of 1:1000 for at least one hour. Chemiluminescent detection was performed.
**All lanes**: Anti-PAX6 antibody (ab5790)

**Lane 1**: rat whole eye extract

**Lane 2**: ovine retinal extract

**Predicted band size**: 50.6 kDa

**Observed band size**: 47 kDa

*why is the actual band size different from the predicted?*

Shows a Western blot of PAX6 on ovine retinal extract using ab5790.

ab5790 staining PAX6 in murine brain cells by Immunocytochemistry/Immunofluorescence.

Cells were fixed in paraformaldehyde, blocked using 5% BSA for 1 hour at room temperature and then incubated with ab5790 at a 1/250 dilution for 4 hours at 4°C. The secondary used was a Cy2 conjugated goat anti-rabbit polyclonal used at a 1/1000 dilution.

**Please note**: All products are “FOR RESEARCH USE ONLY. NOT FOR USE IN DIAGNOSTIC PROCEDURES”

**Our Abpromise to you: Quality guaranteed and expert technical support**

- Replacement or refund for products not performing as stated on the datasheet
- Valid for 12 months from date of delivery
- Response to your inquiry within 24 hours
- We provide support in Chinese, English, French, German, Japanese and Spanish
- Extensive multi-media technical resources to help you
- We investigate all quality concerns to ensure our products perform to the highest standards

If the product does not perform as described on this datasheet, we will offer a refund or replacement. For full details of the Abpromise,
please visit https://www.abcam.com/abpromise or contact our technical team.

Terms and conditions

- Guarantee only valid for products bought direct from Abcam or one of our authorized distributors
