ab108782

Varicella Zoster Virus (VZV) IgG Human ELISA Kit

Instructions for Use

For the qualitative determination of IgG class antibodies against Varicella Zoster Virus (VZV) in Human serum or plasma (citrate).

This product is for research use only and is not intended for in vitro diagnostic use.

1. Introduction

*ab108782 Varicella Zoster Virus (VZV) IgG Human ELISA Kit* is intended for the qualitative determination of IgG class antibodies to Varicella Zoster Virus (VZV) in human serum or plasma (citrate).

Varicella-Zoster Virus (human herpes virus 3, HHV-3) belongs to the alpha-subfamily of herpesviridae. The virus particles measure about 145 nm in diameter. They consist of double stranded DNA, are surrounded by an icosahedral protein capsid and an envelope which contains both host cells and viral components. The virus is usually transmitted in respiratory secretions, and a single serotype causes varicella (Chickenpox), a highly infectious childhood disease, and zoster (shingles), a neurodermic disease; both diseases are found world-wide. Varicella is the acute disease which follows primary contact with the virus, whereas zoster is the response of the partially immune host to a reactivation of the varicella virus present in the body in latent form. Varicella is endemic, most commonly affected are children between 2 and 6 years of age. The course of disease is usually mild and complicated only in immunocompromised children. Rare fatal cases show multiple necrotic lesions in brain, lung (varicella pneumonia), kidneys (hemorrhagic nephritis), spleen, bone marrow, and occasionally in the intestinal tract. The lethality of varicella is below 0.1%.
2. Assay Summary

*ab108782 is for the qualitative immunoenzymatic determination of IgG-class antibodies against Varicella Zoster Virus (VZV) and is based on the ELISA (Enzyme-linked Immunosorbent Assay) technique.*

Microtiter strip wells are precoated with Varicella Zoster Virus (VZV) antigens to bind corresponding antibodies of the specimen.

↓

After washing the wells to remove all unbound sample material horseradish peroxidase (HRP) labeled anti-human IgG conjugate is added. This conjugate binds to the captured Varicella Zoster Virus (VZV)-specific antibodies.

↓

The immune complex formed by the bound conjugate is visualized by adding Tetramethylbenzidine (TMB) substrate which gives a blue reaction product. The intensity of this product is proportional to the amount of Varicella Zoster Virus (VZV)-specific IgG antibodies in the specimen.

↓

Sulphuric acid is added to stop the reaction. This produces a yellow endpoint color. Absorption at 450 nm is read using an ELISA microwell plate reader.
3. Kit Contents

- **Varicella Zoster Virus (VZV) Coated Wells (IgG):** 12 break apart 8-well snap-off strips coated with Varicella Zoster Virus (VZV) antigen; in resealable aluminium foil.

- **IgG Sample Diluent ***:** 1 bottle containing 100 ml of buffer for sample dilution; pH 7.2 ± 0.2; colored yellow; ready to use; white cap.

- **Stop Solution:** 1 bottle containing 15 ml sulphuric acid, 0.2 mol/l; ready to use; red cap.

- **Washing Solution (20x conc.)*:** 1 bottle containing 50 ml of a 20-fold concentrated buffer (pH 7.2 ± 0.2) for washing the wells; white cap.

- **Varicella Zoster Virus (VZV) anti-IgG Conjugate**: 1 bottle containing 20 ml of peroxidase labeled rabbit antibody to human IgG; colored blue, ready to use; black cap.

- **TMB Substrate Solution:** 1 bottle containing 15 ml 3,3',5,5'-tetramethylbenzidine (TMB); ready to use; yellow cap.

- **Varicella Zoster Virus (VZV) IgG Positive Control***: 1 bottle containing 2 ml; colored yellow; ready to use; red cap.

- **Varicella Zoster Virus (VZV) IgG Cut-off Control***: 1 bottle containing 3 ml; colored yellow; ready to use; green cap.

- **Varicella Zoster Virus (VZV) IgG Negative Control***: 1 bottle containing 2 ml; colored yellow; ready to use; blue cap.
**ab108782 Varicella Zoster Virus (VZV) IgG Human ELISA Kit**

- **Strip holder:** 1
- **Cover foil:** 1

* contains 0.1 % Bronidox L after dilution
** contains 0.2 % Bronidox L
*** contains 0.1 % Kathon

**4. Storage and Handling**

The reagents are stable up to the expiry date stated on the label when stored at 2 - 8°C.

**5. Additional Materials Required**

- ELISA microwell plate reader, equipped for the measurement of absorbance at 450/620 nm
- Incubator 37°C
- Manual or automatic equipment for rinsing wells
- Pipettes to deliver volumes between 10 and 1000 µl
- Vortex tube mixer
- Deionised or (freshly) distilled water
- Disposable tubes
- Timer
6. Preparation of Reagents

1. It is very important to bring all reagents, samples and standards to room temperature (20 - 25°C) before starting the test run.

2. **Coated snap-off Strips:** The ready to use break apart snap-off strips are coated with Varicella Zoster Virus (VZV) antigen. Store at 2 - 8°C. *Immediately after removal of strips, the remaining strips should be resealed in the aluminium foil along with the desiccant supplied and stored at 2-8°C; stability until expiry date.*

3. **Varicella Zoster Virus (VZV) anti-IgG Conjugate:** The bottle contains 20 ml of a solution with anti-human-IgG horseradish peroxidase, buffer, stabilizers, preservatives and an inert blue dye. The solution is ready to use. Store at 2 - 8°C. *After first opening stability until expiry date when stored at 2 - 8°C.*

4. **Controls:** The bottles labeled with Positive, Cut-off and Negative Control contain a ready to use control solution. It contains 0.1% Kathon and has to be stored at 2 - 8°C. *After first opening stability until expiry date when stored at 2 - 8°C.*

5. **IgG Sample Diluent:** The bottle contains 100 ml phosphate buffer, stabilizers, preservatives and an inert yellow dye. It is used for the dilution of the specimen. This ready to use solution has to be stored at 2 - 8°C. *After first opening stability until expiry date when stored at 2 - 8°C.*
6. **Washing Solution (20x conc.):** The bottle contains 50 ml of a concentrated buffer, detergents and preservatives. Dilute Washing Solution 1+19; e.g. 10 ml Washing Solution + 190 ml fresh and germ free redistilled water. The diluted buffer is stable for 5 days at room temperature. *Crystals in the solution disappear by warming up to 37°C in a water bath.* After first opening stability until expiry date when stored at 2 - 8°C.

7. **TMB Substrate Solution:** The bottle contains 15 ml of a tetramethylbenzidine/hydrogen peroxide system. The reagent is ready to use and has to be stored at 2 - 8°C away from the light. *The solution should be colorless or could have a slight blue tinge. If the substrate turns into blue, it may have become contaminated and should be thrown away.* After first opening stability until expiry date when stored at 2 - 8°C.

8. **Stop Solution:** The bottle contains 15 ml 0.2 M sulphuric acid solution (R 36/38, S 26). This ready to use solution has to be stored at 2 - 8°C. *After first opening stability until expiry date.*

### 7. Preparation and Collection of Specimen

Use human serum or plasma (citrate) samples with this assay. If the assay is performed within 5 days after sample collection, the specimen should be kept at 2 - 8°C; otherwise they should be aliquoted and stored deep-frozen (-20 to -70°C).
stored frozen, mix thawed samples well before testing. *Avoid repeated freezing and thawing.*

Heat inactivation of samples is not recommended.

**Sample Dilution:**

Before assaying, all samples should be diluted 1+100 with IgG Sample Diluent. Dispense 10µl sample and 1ml IgG Sample Diluent into tubes to obtain a 1+100 dilution and thoroughly mix with a Vortex.

**8. Assay Method**

**Test Preparation**

Please read the test protocol carefully **before** performing the assay. Result reliability depends on strict adherence to the test protocol as described. If performing the test on ELISA automatic systems we recommend to increase the washing steps from three to five and the volume of washing solution from 300µl to 350µl to avoid washing effects. Prior to commencing the assay, the distribution and identification plan for all specimens and controls should be carefully established. Select the required number of microtiter strips or wells and insert them into the holder.
Please allocate at least:

- 1 well (e.g. A1) for the blank
- 1 well (e.g. B1) for the negative control
- 2 wells (e.g. C1+D1) for the cut-off control and
- 1 well (e.g. E1) for the positive control

- *It is recommended to determine controls and samples in duplicate, if necessary.*
- Perform all assay steps in the order given and without any appreciable delays between the steps.
- A clean, disposable tip should be used for dispensing each standard and each sample.
- Adjust the incubator to 37° ± 1°C.

**Assay Procedure:**

1. Dispense 100 µl controls and diluted samples into their respective wells. Leave well A1 for substrate blank.
2. Cover wells with the foil supplied in the kit.
3. **Incubate for 1 hour ± 5 min at 37±1°C.**
4. When incubation has been completed, remove the foil, aspirate the content of the wells and wash each well three times with 300 µl of Washing Solution. Avoid overflows from the reaction wells. The soak time between each wash cycle should be >5 sec. At the end carefully remove remaining fluid by tapping strips on tissue paper prior to the next step!
Note: Washing is critical! Insufficient washing results in poor precision and falsely elevated absorbance values.

5. Dispense 100 µl Varicella Zoster Virus (VZV) anti-IgG Conjugate into all wells except for the blank well (e.g. A1). Cover with foil.

6. **Incubate for 30 min at room temperature.** Do not expose to direct sunlight.

7. Repeat step 4.

8. Dispense 100µl TMB Substrate Solution into all wells.

9. **Incubate for exactly 15 min at room temperature in the dark.**

10. Dispense 100 µl Stop Solution into all wells in the same order and at the same rate as for the TMB Substrate Solution. Any blue colour developed during the incubation turns into yellow.

Note: Highly positive samples can cause dark precipitates of the chromogen! These precipitates have an influence when reading the optical density. Predilution of the sample with physiological sodium chloride solution, for example 1+1, is recommended. Then dilute the sample 1+100 with dilution buffer and multiply the results in NTU by 2.

11. Measure the absorbance of the specimen at 450/620 nm within 30 min after addition of the Stop Solution.

**Measurement:**

Adjust the ELISA Microwell Plate Reader to zero using the substrate blank in well A1.
If - due to technical reasons - the ELISA reader cannot be adjusted to zero using the substrate blank in well A1, subtract the absorbance value of well A1 from all other absorbance values measured in order to obtain reliable results!

Measure the absorbance of all wells at 450 nm and record the absorbance values for each standard and sample.

Dual wavelength reading using 620 nm as reference wavelength is recommended.

Where applicable calculate the mean absorbance values of all duplicates.

9. Data Analysis

A. Run Validation Criteria

In order for an assay to be considered valid, the following criteria must be met:

Substrate blank in A1: Absorbance value < 0.100.

Negative control in B1: Absorbance value < 0.200 and < cut-off.

Cut-off control in C1 and D1: Absorbance value 0.150 – 1.300.

Positive control in E1: Absorbance value > cut-off.
If these criteria are not met, the test is not valid and must be repeated.

B. Calculation of Results

The cut-off is the mean absorbance value of the Cut-off control determinations.

*Example: Absorbance value Cut-off control 0.39 + absorbance value Cut-off control 0.37 = 0.76 / 2 = 0.38*

*Cut-off = 0.38*

C. Interpretation of Results

Samples are considered **POSITIVE** if the absorbance value is higher than 10% over the cut-off.

Samples with an absorbance value of 10% above or below the cut-off should not be considered as clearly positive or negative → grey zone

It is recommended to repeat the test again 2 - 4 weeks later with a fresh sample. If results in the second test are again in the grey zone the sample has to be considered **NEGATIVE**.
Samples are considered **NEGATIVE** if the absorbance value is lower than 10% below the cut-off.

**D. Results in Abcam Units**

Sample (mean) absorbance value x 10 = [Abcam Units = NTU]

Cut off

Example: \(1.786 \times 10 = 47 \text{ NTU [Abcam Units = NTU]}\)

\[
\frac{0.38}{\text{Cut-off:}} = 10 \text{ NTU}
\]

Grey zone: 9-11 NTU

Negative: <9 NTU

Positive: >11 NTU

**E. Precision**

<table>
<thead>
<tr>
<th>Inter-assay</th>
<th>n</th>
<th>Mean (NTU)</th>
<th>Cv (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pos. Serum</td>
<td>24</td>

<td>1.350</td>
<td>2.4</td>
</tr>
</tbody>
</table>

**F. Specificity**

The specificity is defined as the probability of the assay of scoring negative in the absence of the specific analyte. It is > 95 %.
G. Sensitivity

The sensitivity is defined as the probability of the assay of scoring positive in the presence of the specific analyte. It is 92.9 %.

H. Interferences

Interferences with hemolytic, lipemic or icteric sera are not observed up to a concentration of 10 mg/ml hemoglobin, 5 mg/ml triglycerides and 0.2 mg/ml bilirubin.

Note: The results refer to the groups of samples investigated; these are not guaranteed specifications.

10. Limitations

- Bacterial contamination or repeated freeze-thaw cycles of the specimen may affect the absorbance values.
11. Troubleshooting
