ab108800 –
Antithrombin III ELISA Kit

Instructions for Use

For the quantitative measurement of Mouse Antithrombin III concentrations in cell culture supernatants, plasma and serum.

This product is for research use only and is not intended for diagnostic use.

1. **BACKGROUND**

Abcam’s Antithrombin III (AT III) mouse ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for the quantitative measurement of Antithrombin III concentrations in mouse cell culture supernatants, serum and plasma.

The serine-protease-inhibitor Antithrombin III (AT III), the most important natural inhibitor of thrombin activity, has been shown to exert marked anti-inflammatory properties and proven to be efficacious in experimental models of sepsis, septic shock, and disseminated intravascular coagulation. It has often been recommended for the therapy of septic patients as it provides anticoagulant and anti-inflammatory actions. AT III deficiency is a rare hereditary disease that predisposes to thromboembolic complications. AT III levels are positively correlated with plasma total cholesterol levels, plasma low-density lipoprotein cholesterol levels, plasma triglycerides and D-dimer levels.
2. **ASSAY SUMMARY**

Prepare all reagents, samples and standards as instructed.

Add standard or sample to each well used. Incubate at room temperature.

Add prepared biotin antibody to each well. Incubate at room temperature.

Add prepared Streptavidin-Peroxidase Conjugate. Incubate at room temperature.

Add Chromogen Substrate to each well. Incubate at room temperature. Add Stop Solution to each well. Read immediately.
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at 4°C immediately upon receipt, apart from the SP conjugate & Biotinylated Antibody, which should be stored at -20°C.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in sections 9 & 10.

5. **MATERIALS SUPPLIED**

6. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully utilize this assay:

- 1 Microplate reader capable of measuring absorbance at 450 nm.
- Precision pipettes to deliver 1 µL to 1 mL volumes.
- Adjustable 1-25 mL pipettes for reagent preparation.
- 100 mL and 1 liter graduated cylinders.
- Absorbent paper.
- Distilled or deionized water.
- Log-log graph paper or computer and software for ELISA data analysis.
- 8 tubes to prepare standard or sample dilutions.

7. **LIMITATIONS**

- Do not mix or substitute reagents or materials from other kit lots or vendors.
8. **TECHNICAL HINTS**

- Samples generating values higher than the highest standard should be further diluted in the appropriate sample dilution buffers.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps.
- Complete removal of all solutions and buffers during wash steps.
- **This kit is sold based on number of tests.** A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
9. **REAGENT PREPARATION**

Equilibrate all reagents to room temperature (18-25°C) prior to use. Prepare fresh reagents immediately prior to use. If crystals have formed in the concentrate, mix gently until the crystals have completely dissolved.

9.1 **1X Diluent N**

Dilute the 10X Diluent N Concentrate 1:10 with reagent grade water. Mix gently and thoroughly. *Store for up to 1 month at 2 - 8°C.*

9.2 **1X Wash Buffer**

Dilute the 20X Wash Buffer Concentrate 1:20 with reagent grade water. Mix gently and thoroughly.

9.3 **1X Biotinylated Antithrombin III Detector Antibody**

9.3.1 The stock Biotinylated Antithrombin III Antibody must be diluted with 1X Diluent N according to the label concentration to prepare 1X Biotinylated Antithrombin III Detector Antibody for use in the assay procedure. Observe the label for the “X” concentration on the vial of Biotinylated Antithrombin III Antibody.

9.3.2 Calculate the necessary amount of 1X Diluent N to dilute the Biotinylated Antithrombin III Antibody to prepare a 1X Biotinylated Antithrombin III Detector Antibody solution for use in the assay procedure according to how many wells you wish to use and the following calculation:

<table>
<thead>
<tr>
<th>Number of Wells Strips</th>
<th>Number of Wells</th>
<th>((V_T)) Total Volume of 1X Biotinylated Detector Antibody (µL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>32</td>
<td>1,760</td>
</tr>
<tr>
<td>6</td>
<td>48</td>
<td>2,640</td>
</tr>
<tr>
<td>8</td>
<td>64</td>
<td>3,520</td>
</tr>
<tr>
<td>10</td>
<td>80</td>
<td>4,400</td>
</tr>
<tr>
<td>12</td>
<td>96</td>
<td>5,280</td>
</tr>
</tbody>
</table>

*Any remaining solution should be frozen at -20°C.*
ASSAY PREPARATION

Where:

\( C_S = \) Starting concentration (X) of stock Biotinylated Antithrombin III Antibody (variable)

\( C_F = \) Final concentration (always = 1X) of 1X Biotinylated Antithrombin III Detector Antibody solution for the assay procedure

\( V_T = \) Total required volume of 1X Biotinylated Antithrombin III Detector Antibody solution for the assay procedure

\( V_A = \) Total volume of (X) stock Biotinylated Antithrombin III Antibody

\( V_D = \) Total volume of 1X Diluent N required to dilute (X) stock Biotinylated Antithrombin III Antibody to prepare 1X Biotinylated Detector Antibody solution for assay procedures

a. Calculate the volume of (X) stock Biotinylated Antibody required for the given number of desired wells:

\[
\frac{C_F}{C_S} \times V_T = V_A
\]

b. Calculate the final volume of 2X Diluent N required to prepare the 1X Biotinylated Antithrombin III Detector Antibody:

\[
V_T - V_A = V_D
\]

Example:

\( C_S = \) 50X Biotinylated Antithrombin III Antibody stock

\( C_F = \) 1X Biotinylated Antithrombin III Detector Antibody solution for use in the assay procedure

\( V_T = \) 3,520 µL (8 well strips or 64 wells)

\[
(1X/50X) \times 3,520 \, \mu\text{L} = 70.4 \, \mu\text{L}
\]

3,520 µL - 70.4 µL = 3,449.6 µL

\( V_A = \) 70.4 µL total volume of (X) stock Biotinylated Antithrombin III Antibody required

\( V_D = \) 3,449.6 µL total volume of 1X Diluent N required to dilute the 50X stock Biotinylated Antibody to prepare 1X Biotinylated Antithrombin III Detector Antibody solution for assay procedures

9.3.3 First spin the Biotinylated Antithrombin III Antibody vial to collect the contents at the bottom.
9.3.4 Add calculated amount $V_A$ of stock Biotinylated Antithrombin III Antibody to the calculated amount $V_D$ of 1X Assay Diluent N. Mix gently and thoroughly.

9.4 **1X SP Conjugate**
Spin down the 100X Streptavidin-Peroxidase Conjugate (SP Conjugate) briefly and dilute the desired amount of the conjugate 1:100 with 1X Diluent N.

*Any remaining solution should be frozen at -20°C.*

10. **STANDARD PREPARATIONS**
- Prepare serially diluted standards immediately prior to use. Always prepare a fresh set of standards for every use.
- Any remaining standard should be stored at -20°C after reconstitution and used within 30 days.
- This procedure prepares sufficient standard dilutions for duplicate wells.

10.1 Reconstitution of the stock Antithrombin III Standard vial to prepare a 1.2 µg/mL Antithrombin III Standard:
   10.1.1 First consult the Antithrombin III Standard vial to determine the mass of protein in the vial.
   10.1.2 Calculate the appropriate volume of 1X Diluent N to add when resuspending the Antithrombin III Standard vial to produce a 1.2 µg/mL Antithrombin III Standard stock by using the following equation:
**ASSAY PREPARATION**

\[ C_S = \text{Starting mass of Antithrombin Standard stock (see vial label) (µg)} \]
\[ C_F = 1.2 \text{ µg/mL Antithrombin III Standard final required concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution (µL)} \]

Calculate total required volume 1X Diluent N for resuspension:

\[
(C_F / C_S) \times 1000 \text{ µL} = V_D
\]

**Example:**

- \( C_S = 100 \text{ µg of Antithrombin III Standard in vial} \)
- \( C_F = 1.2 \text{ µg/mL Antithrombin III Standard final concentration} \)
- \( V_D = \text{Required volume of 1X Diluent N for reconstitution} \)

\[
(1 \text{ µg} / 1.2 \text{ µg/mL}) \times 1000 \text{ µL} = 833.3 \text{ µL}
\]

10.1.3 First briefly spin the Antithrombin III Standard Vial to collect the contents on the bottom of the tube.

10.1.4 Reconstitute the Antithrombin III Standard vial by adding the appropriate calculated amount \( V_D \) of 1X Diluent N to the vial to generate the 1.2 µg/mL Antithrombin III Standard. Mix gently and thoroughly.

10.2 Allow the reconstituted 1.2 µg/mL Antithrombin III Standard to sit for 10 minutes with gentle agitation prior to making subsequent dilutions.

10.3 Label seven tubes #1-7.

10.4 Prepare the 200 ng/mL **Standard #1** by adding 83.8 µL of the reconstituted 1.2 µg/mL Antithrombin III Standard to 416.7 µL of 1X Diluent N and mix thoroughly and gently.

10.5 Add 120 µL of 1X Diluent N to tube #2 – 7.

10.6 To prepare **Standard #2**, add 120 µL of the **Standard #1** into tube #2 and mix gently.
10.7 To prepare **Standard #3**, add 120 µL of the **Standard #2** into tube #3 and mix gently.

10.8 Using the table below as a guide, prepare subsequent serial dilutions.

**Standard Dilution Preparation Table**

11. **SAMPLE PREPARATION**

11.1 **Plasma**
Collect plasma using one-tenth volume of 0.1 M sodium citrate as an anticoagulant. Centrifuge samples at 2,000 x g for 10 minutes and assay. Dilute samples 1:16,000 into 1X Diluent N. Store samples at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles. (EDTA or Heparin can also be used as anticoagulant).

11.2 **Serum**
Samples should be collected into a serum separator tube. After clot formation, centrifuge samples at 2,000 x g for 10 minutes. Remove serum and assay. Dilute samples 1:16,000 into 1X Diluent N. Store serum at -20°C or below. Avoid repeated freeze-thaw cycles.

11.3 **Cell Culture Supernatants**
Centrifuge cell culture media at 2,000 x g for 10 minutes to remove debris. Collect supernatants and assay. Store samples at -20°C or below. Avoid repeated freeze-thaw cycles.

14 **PLATE PREPARATION**

- The 96 well plate strips included with this kit are supplied ready to use. It is not necessary to rinse the plate prior to adding reagents.
- Unused well plate strips should be returned to the plate packet and stored at 4°C.
- For each assay performed, a minimum of 2 wells must be used as blanks, omitting primary antibody from well additions.
- For statistical reasons, we recommend each sample should be assayed with a minimum of two replicates (duplicates).
- Well effects have not been observed with this assay. Contents of each well can be recorded on the template sheet included in the Resources section.
13. ASSAY PROCEDURE

- Equilibrate all materials and prepared reagents to room temperature (18 - 25°C) prior to use.
- It is recommended to assay all standards, controls and samples in duplicate.

13.1 Prepare all reagents, working standards and samples as instructed. Equilibrate reagents to room temperature before use. The assay is performed at room temperature (20-30°C).

13.2 Remove excess microplate strips from the plate frame and return them immediately to the foil pouch with desiccant inside. Reseal the pouch securely to minimize exposure to water vapor and store in a vacuum desiccator.

13.3 Add 50 μL of standard or sample per well. Cover wells with a sealing tape and incubate for two hours. Start the timer after the last sample addition.

13.4 Wash five times with 200 μL of 1X Wash Buffer manually. Invert the plate each time and decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid. If using a machine wash six times with 300 μL of 1X Wash Buffer and then invert the plate, decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid.

13.5 Add 50 μL of 1X Biotinylated Antithrombin III Detector Antibody to each well and incubate for one hour.

13.6 Wash microplate as described above.

13.7 Add 50 μL of 1X SP Conjugate to each well and incubate for 30 minutes. Turn on the microplate reader and set up the program in advance.

13.8 Wash microplate as described above.

13.9 Add 50 μL of Chromogen Substrate per well and incubate for about 30 minutes or till the optimal blue colour density
develops. Gently tap plate to ensure thorough mixing and break the bubbles in the well with pipette tip.

13.10 Add 50 μL of Stop Solution to each well. The color will change from blue to yellow.

13.11 Read the absorbance on a microplate reader at a wavelength of 450 nm immediately. If wavelength correction is available, subtract readings at 570 nm from those at 450 nm to correct optical imperfections. Otherwise, read the plate at 450 nm only. Please note that some unstable black particles may be generated at high concentration points after stopping the reaction for about 10 minutes, which will reduce the readings.
14. **CALCULATIONS**

Calculate the mean value of the triplicate readings for each standard and sample. To generate a Standard Curve, plot the graph using the standard concentrations on the x-axis and the corresponding mean 450 nm absorbance on the y-axis. The best-fit line can be determined by regression analysis using log-log or four-parameter logistic curve-fit. Determine the unknown sample concentration from the Standard Curve and multiply the value by the dilution factor.
15. **TYPICAL DATA**

**TYPICAL STANDARD CURVE** – Data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.
16. **TYPICAL SAMPLE VALUES**

**SENSITIVITY –**

The minimum detectable dose of Antithrombin III is typically 0.4 ng/mL.

**RECOVERY –**

Standard Added Value: 2 – 20 ng/mL

Recovery %: 85 – 112.

Average Recovery %: 97

**LINEARITY OF DILUTION –**
