INTRODUCTION

1. BACKGROUND

Abcam’s Factor XII Human in vitro ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for the quantitative measurement of Factor XII concentrations in plasma, serum, milk, urine, CSF and cell culture samples.

A Factor XII specific antibody has been precoated onto 96-well plates and blocked. Standards or test samples are added to the wells and subsequently a Factor XII specific biotinylated detection antibody is added and then followed by washing with wash buffer. Streptavidin-Peroxidase Complex is added and unbound conjugates are washed away with wash buffer. TMB is then used to visualize Streptavidin-Peroxidase enzymatic reaction. TMB is catalyzed by Streptavidin-Peroxidase to produce a blue color product that changes into yellow after adding acidic stop solution. The density of yellow coloration is directly proportional to the amount of Factor XII captured in plate.

Human coagulation factor XII, Hageman factor, is a plasma serine protease existing in the zymogen form. Upon contacting with negatively charged artificial or biologic surfaces, Factor XII is autoactivated into Factor XIIa that initiates intrinsic blood coagulation, fibrinolysis, and activation of the inflammatory kallikrein-kinin and complement systems. Factor XII has 615 amino acids, weighs 80 kDa, and circulates in normal plasma at a concentration of 30 μg/mL. It is a multidomain protein with structure similarity to EGF, single chain urokinase, and tissue plasminogen activator. In the intravascular compartment, Factor XII binds to endothelial cell urokinase plasminogen activator receptor, cytokeratin 1, and the complement receptor. Factor XII deficiency or blockade protects from cerebral ischemia without overtly affecting hemostasis. Factor XII inhibition could be a novel target for safer anticoagulation and stroke prevention without the side effect of increased bleeding.
2. **ASSAY SUMMARY**

- **Primary capture antibody**
  - Prepare all reagents, samples and standards as instructed.

- **Sample**
  - Add standard or sample to each well used. Incubate at room temperature.

- **Primary detector antibody**
  - Wash and add prepared biotin antibody to each well. Incubate at room temperature.

- **Streptavidin Label**
  - Wash and add prepared Streptavidin-Peroxidase Conjugate. Incubate at room temperature.

- **Substrate Colored product**
  - Add Chromogen Substrate to each well. Incubate at room temperature. Add Stop Solution to each well. Read immediately.
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at 4°C immediately upon receipt, apart from the SP Conjugate & Biotinylated Antibody, which should be stored at -20°C.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in sections 9 & 10.

5. **MATERIALS SUPPLIED**

6. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully utilize this assay:

- 1 Microplate reader capable of measuring absorbance at 450 nm.
- Precision pipettes to deliver 1 µL to 1 mL volumes.
- Adjustable 1-25 mL pipettes for reagent preparation.
- 100 mL and 1 liter graduated cylinders.
- Absorbent paper.
- Distilled or deionized water.
- Log-log graph paper or computer and software for ELISA data analysis.
- 8 tubes to prepare standard or sample dilutions.

7. **LIMITATIONS**

- Do not mix or substitute reagents or materials from other kit lots or vendors.
8. **TECHNICAL HINTS**

- Samples generating values higher than the highest standard should be further diluted in the appropriate sample dilution buffers.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps.
- Complete removal of all solutions and buffers during wash steps.
- **This kit is sold based on number of tests.** A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
9. REAGENT PREPARATION

Equilibrate all reagents to room temperature (18-25°C) prior to use. Prepare fresh reagents immediately prior to use. If crystals have formed in the concentrate, mix gently until the crystals have completely dissolved.

9.1 1X Diluent N

Dilute the 10X Diluent N Concentrate 1:10 with reagent grade water. Mix gently and thoroughly. Store for up to 1 month at 4°C.

9.2 1X Wash Buffer

Dilute the 20X Wash Buffer Concentrate 1:20 with reagent grade water. Mix gently and thoroughly.

9.3 1X Biotinylated Factor XII Detector Antibody

9.3.1 The stock Biotinylated Factor XII Antibody must be diluted with 1X Diluent N according to the label concentration to prepare 1X Biotinylated Factor XII Antibody for use in the assay procedure. Observe the label for the “X” concentration on the vial of Biotinylated Factor XII Antibody.

9.3.2 Calculate the necessary amount of 1X Diluent N to dilute the Biotinylated Factor XII Antibody to prepare a 1X Biotinylated Factor XII Antibody solution for use in the assay procedure according to how many wells you wish to use and the following calculation:

<table>
<thead>
<tr>
<th>Number of Wells Strips</th>
<th>Number of Wells</th>
<th>((V_T))</th>
<th>Total Volume of 1X Biotinylated Antibody (µL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>32</td>
<td></td>
<td>1,760</td>
</tr>
<tr>
<td>6</td>
<td>48</td>
<td></td>
<td>2,640</td>
</tr>
<tr>
<td>8</td>
<td>64</td>
<td></td>
<td>3,520</td>
</tr>
<tr>
<td>10</td>
<td>80</td>
<td></td>
<td>4,400</td>
</tr>
<tr>
<td>12</td>
<td>96</td>
<td></td>
<td>5,280</td>
</tr>
</tbody>
</table>

Any remaining solution should be frozen at -20°C.
ASSAY PREPARATION

Where:

- $C_S$ = Starting concentration (X) of stock Biotinylated Factor XII Antibody (variable)
- $C_F$ = Final concentration (always = 1X) of 1X Biotinylated Factor XII Antibody solution for the assay procedure
- $V_T$ = Total required volume of 1X Biotinylated Factor XII Antibody solution for the assay procedure
- $V_A$ = Total volume of (X) stock Biotinylated Factor XII Antibody
- $V_D$ = Total volume of 1X Diluent N required to dilute (X) stock Biotinylated Factor XII Antibody to prepare 1X Biotinylated Factor XII solution for assay procedures

Calculate the volume of (X) stock Biotinylated Antibody required for the given number of desired wells:

$$ (C_F / C_S) \times V_T = V_A $$

Calculate the final volume of 1X Diluent N required to prepare the 1X Biotinylated Factor XII Antibody:

$$ V_T - V_A = V_D $$

Example:

**NOTE:** This example is for demonstration purposes only. Please remember to check your antibody vial for the actual concentration of antibody provided.

- $C_S$ = 50X Biotinylated Factor XII Antibody stock
- $C_F$ = 1X Biotinylated Factor XII Antibody solution for use in the assay procedure
- $V_T$ = 3,520 µL (8 well strips or 64 wells)
  - $(1X/50X) \times 3,520 \mu L = 70.4 \mu L$
  - $3,520 \mu L - 70.4 \mu L = 3,449.6 \mu L$
- $V_A$ = 70.4 µL total volume of (X) stock Biotinylated Factor XII Antibody required
- $V_D$ = 3,449.6 µL total volume of 1X Diluent N required to dilute the 50X stock Biotinylated Antibody to prepare 1X Biotinylated Factor XII Antibody solution for assay procedures
9.3.3 First spin the Biotinylated Factor XII Antibody vial to collect the contents at the bottom.

9.3.4 Add calculated amount $V_A$ of stock Biotinylated Factor XII Antibody to the calculated amount $V_D$ of 1X Diluent N. Mix gently and thoroughly.

9.4 1X SP Conjugate

Spin down the 100X Streptavidin-Peroxidase Conjugate (SP Conjugate) briefly and dilute the desired amount of the conjugate 1:100 with 1X Diluent N.

Any remaining solution should be frozen at -20°C.
10. STANDARD PREPARATIONS

- Prepare serially diluted standards immediately prior to use. Always prepare a fresh set of standards for every use.
- Any remaining standard should be stored at -20°C after reconstitution and used within 30 days.
- This procedure prepares sufficient standard dilutions for duplicate wells.

10.1 Reconstitution of the Factor XII Standard vial to prepare the 100 ng/mL Factor XII Standard #1.

10.1.1 First consult the Factor XII Standard vial to determine the mass of protein in the vial.

10.1.2 Calculate the appropriate volume of 1X Diluent N to add when resuspending the Factor XII Standard vial to produce a 100 ng/mL Factor XII Standard #1 by using the following equation:

\[ C_S = \text{Starting mass of Factor XII Standard (see vial label)} \text{ (ng)} \]
\[ C_F = 100 \text{ ng/mL Factor XII Standard #1 final required concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution (µL)} \]

Calculate total required volume 1X Diluent N for resuspension:

\[ \left( \frac{C_S}{C_F} \right) \times 1,000 = V_D \]

Example:

NOTE: This example is for demonstration purposes only. Please remember to check your standard vial for the actual amount of standard provided.

\[ C_S = 250 \text{ ng of Factor XII Standard in vial} \]
\[ C_F = 100 \text{ ng/mL Factor XII Standard #1 final concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution} \]

\[ (250 \text{ ng} / 100 \text{ ng/mL}) \times 1,000 = 2,500 \text{ µL} \]
10.1.3 Reconstitute the Factor XII Standard vial by adding the appropriate calculated amount $V_D$ of 1X Diluent N to the vial to generate the 100 ng/mL Factor XII Standard #1. Mix gently and thoroughly.

10.2 Allow the reconstituted 100 ng/mL Factor XII Standard #1 to sit for 10 minutes with gentle agitation prior to making subsequent dilutions.

10.3 Label seven tubes #2 – 8.

10.4 Add 360 µL of 1X Diluent N to tubes #2 – 8.

10.5 To prepare Standard #2, add 120 µL of the Standard #1 into tube #2 and mix gently.

10.6 To prepare Standard #3, add 120 µL of the Standard #2 into tube #3 and mix gently.

10.7 Using the table below as a guide, prepare subsequent serial dilutions.

10.8 1X Diluent N serves as the zero standard, 0 ng/mL (tube #8).

11. SAMPLE PREPARATION

11.1 Plasma
Collect plasma using one-tenth volume of 0.1 M sodium citrate as an anticoagulant. Centrifuge samples at 3,000 x g for 10 minutes and collect supernatants. Dilute samples 1:1,000 into 1X Diluent N or within the range of 1:500 to 1:5000, and assay. Depending on application needs, user should determine proper dilutions. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles. (EDTA or Heparin can also be used as an anticoagulant.)

11.2 Cell Culture Supernatants
Centrifuge cell culture media at 3,000 x g for 10 minutes to remove debris. Collect supernatants and assay. Store samples at -20°C or below. Avoid repeated freeze-thaw cycles.

11.3 Serum
Samples should be collected into a serum separator tube. After clot formation, centrifuge samples at 3,000 x g for 10 minutes and remove serum. Dilute samples 1:1,000 into 1X Diluent N and assay. Depending on application needs, user should determine proper dilutions. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.4 Urine
Collect urine using sample tube. Centrifuge samples at 800 x g for 10 minutes and assay. Store samples at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.5 Milk
Collect milk using sample tube. Centrifuge samples at 800 x g for 10 minutes. Milk dilution is suggested at 1:4 in 1X Diluent N then assay; however, depending on application needs, the user should determine proper dilutions. Store
samples at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.6 CSF
Collect cerebrospinal fluid (CSF) using sample pot. Centrifuge samples at 3,000 x g for 10 minutes. Dilute samples 1:10 into 1X Diluent N and assay. The undiluted samples can be stored at -80°C for up to 3 months. Avoid repeated freeze-thaw cycles.

12. PLATE PREPARATION

- The 96 well plate strips included with this kit are supplied ready to use. It is not necessary to rinse the plate prior to adding reagents.
- Unused well plate strips should be returned to the plate packet and stored at 4°C.
- For statistical reasons, we recommend each sample should be assayed with a minimum of two replicates (duplicates).
- Well effects have not been observed with this assay. Contents of each well can be recorded on the template sheet included in the Resources section.
13. ASSAY PROCEDURE

- Equilibrate all materials and prepared reagents to room temperature (18 - 25°C) prior to use.
- It is recommended to assay all standards, controls and samples in duplicate.

13.1 Prepare all reagents, standard solutions and samples as instructed. Equilibrate reagents to room temperature before use. The assay is performed at room temperature (18-25°C).

13.2 Remove excess microplate strips from the plate frame and return them immediately to the foil pouch with desiccant inside. Reseal the pouch securely to minimize exposure to water vapor and store in a vacuum desiccator.

13.3 Add 50 μL of Factor XII Standard or sample per well. Cover wells with a sealing tape and incubate for two hours. Start the timer after the last sample addition.

13.4 Wash five times with 200 μL of 1X Wash Buffer manually. Invert the plate each time and decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid. If using a machine wash six times with 300 μL of 1X Wash Buffer and then invert the plate, decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid.

13.5 Add 50 μL of 1X Biotinylated Factor XII Antibody to each well and incubate for one hour.

13.6 Wash microplate as described above.

13.7 Add 50 μL of 1X SP Conjugate to each well and incubate for 30 minutes. Turn on the microplate reader and set up the program in advance.

13.8 Wash microplate as described above.

13.9 Add 50 μL of Chromogen Substrate per well and incubate for 30 minutes or till the optimal blue colour density
ASSAY PROCEDURE

develops. Gently tap plate to ensure thorough mixing and break the bubbles in the well with pipette tip.

13.10 Add 50 μL of Stop Solution to each well. The color will change from blue to yellow.

13.11 Read the absorbance on a microplate reader at a wavelength of 450 nm immediately. If wavelength correction is available, subtract readings at 570 nm from those at 450 nm to correct optical imperfections. Otherwise, read the plate at 450 nm only. Please note that some unstable black particles may be generated at high concentration points after stopping the reaction for about 10 minutes, which will reduce the readings.
14. **CALCULATIONS**

Calculate the mean value of the triplicate readings for each standard and sample. To generate a Standard Curve, plot the graph using the standard concentrations on the x-axis and the corresponding mean 450 nm absorbance on the y-axis. The best-fit line can be determined by regression analysis using log-log or four-parameter logistic curve-fit. Determine the unknown sample concentration from the Standard Curve and multiply the value by the dilution factor.
15. **TYPICAL DATA**

**TYPICAL STANDARD CURVE** – Data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.
16. **TYPICAL SAMPLE VALUES**

**SENSITIVITY** –
The minimum detectable dose of Factor XII is typically ~0.02 ng/mL.

**RECOVERY** –
Standard Added Value: 0.098 – 25 ng/mL
Recovery %: 91 – 111.
Average Recovery %: 99

**REFERENCE VALUES**
On average, normal Human factor XII plasma level is 29 μg/mL.

**LINEARITY OF DILUTION** –
