ab108882
Lactoferrin (HLF2)
Human ELISA Kit

For the quantitative measurement of human Lactoferrin (HLF2) in plasma, serum, urine, saliva, milk, cerebrospinal fluid and cell culture supernatants.

This product is for research use only and is not intended for diagnostic use.
1. Overview

Lactoferrin (HLF2) Human in vitro ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for the quantitative measurement of Lactoferrin levels in human cell culture supernatants, serum, urine, saliva, milk, cerebrospinal fluid and plasma.

A Lactoferrin specific antibody has been precoated onto 96-well plates and blocked. Standards or test samples are added to the wells and subsequently a Lactoferrin specific biotinylated detection antibody is added and then followed by washing with wash buffer. Streptavidin-Peroxidase Conjugate is added and unbound conjugates are washed away with wash buffer. TMB is then used to visualize Streptavidin-Peroxidase enzymatic reaction. TMB is catalyzed by Streptavidin-Peroxidase to produce a blue color product that changes into yellow after adding acidic stop solution. The density of yellow coloration is directly proportional to the amount of Lactoferrin captured in plate.

Lactoferrin is an 80 kDa iron-binding glycoprotein produced by many exocrine glands with a major constituent in the secondary granules of neutrophilic leukocytes. Serum Lactoferrin concentration is much higher during inflammation. Lactoferrin is known to be an immune modulator or enhancer due to specific receptors for Lactoferrin that are found on many key immune cells such as lymphocytes, monocytes and macrophages, and is known to be directly involved in the up-regulation of natural killer (NK) cell activity. Lactoferrin is present in maternal milk, saliva, tears, vaginal secretions, semen, bronchoalveolar lavage fluid, and specific granules of polymorphonuclear leukocytes (PMNs). Lactoferrin is found mainly in the oral cavity where it can come into direct contact with pathogens such as viruses, bacteria, etc. Lactoferrin directly inhibits viruses by binding to viral receptor sites, thus preventing the virus from infecting healthy cells. Lactoferrin has a direct bactericidal function to certain bacteria such as Streptococcus mutans, Vibrio cholerae, Escherichia coli, Actinobacillus actinomycetemcomitans, and Legionella pneumophila. Also, it has a bacteriostatic effect that deprives iron-requiring bacteria of this essential growth nutrient. Lactoferrin is also considered an antioxidant that scavenges free iron, helping to prevent uncontrolled iron based free radical reactions, thus protecting certain cells from peroxidation.
2. Protocol Summary

Prepare all reagents, samples, and standards as instructed

Add standard or sample to appropriate wells.
Incubate at room temperature.

Wash and add prepared biotin antibody to each well. Incubate at room temperature.

Wash and add prepared Streptavidin-Peroxidase Conjugate. Incubate at room temperature.

Add Chromogen Substrate to each well. Incubate at room temperature

Add Stop Solution to each well. Read immediately.
3. Precautions

Please read these instructions carefully prior to beginning the assay.

- All kit components have been formulated and quality control tested to function successfully as a kit.
- We understand that, occasionally, experimental protocols might need to be modified to meet unique experimental circumstances. However, we cannot guarantee the performance of the product outside the conditions detailed in this protocol booklet.
- Reagents should be treated as possible mutagens and should be handled with care and disposed of properly. Please review the Safety Datasheet (SDS) provided with the product for information on the specific components.
- Observe good laboratory practices. Gloves, lab coat, and protective eyewear should always be worn. Never pipet by mouth. Do not eat, drink or smoke in the laboratory areas.
- All biological materials should be treated as potentially hazardous and handled as such. They should be disposed of in accordance with established safety procedures.

4. Storage and Stability

Store kit at +4°C immediately upon receipt, apart from the SP Conjugate & Biotinylated Antibody, which should be stored at -20°C. Kit has a storage time of 1 year from receipt, providing components have not been reconstituted.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in the Materials Supplied section.
5. Limitations

- Assay kit intended for research use only. Not for use in diagnostic procedures.
- Do not mix or substitute reagents or materials from other kit lots or vendors. Kits are QC tested as a set of components and performance cannot be guaranteed if utilized separately or substituted.

7. Materials Required, Not Supplied

These materials are not included in the kit, but will be required to successfully perform this assay:

- 1 Microplate reader capable of measuring absorbance at 450 nm.
- Precision pipettes to deliver 1 µL to 1 mL volumes.
- Adjustable 1-25 mL pipettes for reagent preparation.
- 100 mL and 1 liter graduated cylinders.
- Absorbent paper.
- Distilled or deionized water.
- Log-log graph paper or computer and software for ELISA data analysis.
- 6 tubes to prepare standard or sample dilutions.
8. Technical Hints

- This kit is sold based on number of tests. A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.

- Selected components in this kit are supplied in surplus amount to account for additional dilutions, evaporation, or instrumentation settings where higher volumes are required. They should be disposed of in accordance with established safety procedures.

- Make sure all buffers and solutions are at room temperature before starting the experiment.

- Samples generating values higher than the highest standard should be further diluted in the appropriate sample dilution buffers.

- Avoid foaming or bubbles when mixing or reconstituting components.

- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.

- Ensure plates are properly sealed or covered during incubation steps.

- Make sure you have the right type of plate for your detection method of choice.

- Make sure the heat block/water bath and microplate reader are switched on before starting the experiment.
9. Reagent Preparation

- Equilibrate all reagents to room temperature (18-25°C) prior to use. The kit contains enough reagents for 96 wells.
- Prepare only as much reagent as is needed on the day of the experiment.

9.1 1X Diluent N
Dilute the 10X Diluent N Concentrate 1:10 with reagent grade water. Mix gently and thoroughly.

\[ \text{Note} \] Store for up to 1 month at 4°C.

9.2 1X Wash Buffer
Dilute the 20X Wash Buffer Concentrate 1:20 with reagent grade water. Mix gently and thoroughly.

9.3 1X Biotinylated Lactoferrin Detector Antibody

9.3.1 The stock Biotinylated Lactoferrin Antibody must be diluted with 1X Diluent N according to the label concentration to prepare 1X Lactoferrin Antibody for use in the assay procedure. Observe the label for the “X” concentration on the vial of Biotinylated Lactoferrin Antibody.

9.3.2 Calculate the necessary amount of 1X Diluent N to dilute the Biotinylated Lactoferrin Antibody to prepare a 1X Biotinylated Lactoferrin Antibody solution for use in the assay procedure according to how many wells you wish to use and the following calculation:

<table>
<thead>
<tr>
<th>Number of Wells Strips</th>
<th>Number of Wells</th>
<th>( (V_1) )</th>
<th>Total Volume of 1X Biotinylated Antibody (µL)</th>
</tr>
</thead>
<tbody>

<td></td>
<td>5,280</td>
</tr>
</tbody>
</table>

\[ \text{Note} \] Any remaining solution should be frozen at -20°C.
Where:

\[ C_S = \text{Starting concentration (X) of stock Biotinylated Lactoferrin Antibody (variable)} \]

\[ C_F = \text{Final concentration (always = 1X) of 1X Biotinylated Lactoferrin Antibody solution for the assay procedure} \]

\[ V_T = \text{Total required volume of 1X Biotinylated Lactoferrin Antibody solution for the assay procedure} \]

\[ V_A = \text{Total volume of (X) stock Biotinylated Lactoferrin Antibody} \]

\[ V_D = \text{Total volume of 1X Diluent N required to dilute (X) stock Biotinylated Lactoferrin Antibody to prepare 1X Biotinylated Lactoferrin solution for assay procedures} \]

Calculate the volume of (X) stock Biotinylated Antibody required for the given number of desired wells:

\[ \left( \frac{C_F}{C_S} \right) \times V_T = V_A \]

Calculate the final volume of 1X Diluent N required to prepare the 1X Biotinylated Lactoferrin Antibody:

\[ V_T - V_A = V_D \]

Example:

**NOTE:** This example is for demonstration purposes only. Please remember to check your antibody vial for the actual concentration of antibody provided.

\[ C_S = 50X \text{ Biotinylated Lactoferrin Antibody stock} \]

\[ C_F = 1X \text{ Biotinylated Lactoferrin Antibody solution for use in the assay procedure} \]

\[ V_T = 3,520 \mu\text{L (8 well strips or 64 wells)} \]

\[ (1X/50X) \times 3,520 \mu\text{L} = 70.4 \mu\text{L} \]

\[ 3,520 \mu\text{L} - 70.4 \mu\text{L} = 3,449.6 \mu\text{L} \]

\[ V_A = 70.4 \mu\text{L total volume of (X) stock Biotinylated Lactoferrin Antibody required} \]

\[ V_D = 3,449.6 \mu\text{L total volume of 1X Diluent N required to dilute the 50X stock Biotinylated Antibody to prepare 1X Biotinylated Lactoferrin Antibody solution for assay procedure.} \]
9.3.3 First spin the Biotinylated Lactoferrin Antibody vial to collect the contents at the bottom.

9.3.4 Add calculated amount $V_A$ of stock Biotinylated Lactoferrin Antibody to the calculated amount $V_D$ of 1X Assay Diluent N. Mix gently and thoroughly.

9.4 **1X SP Conjugate**

Spin down the 100X Streptavidin-Peroxidase Conjugate (SP Conjugate) briefly and dilute the desired amount of the conjugate 1:100 with 1X Diluent N.

△ **Note** Any remaining solution should be frozen at -20°C.
10. Standard Preparation

- Prepare serially diluted standards immediately prior to use.
- Always prepare a fresh set of standards for every use.
- Any remaining standard should be stored at -20°C after reconstitution and used within 30 days.
- The following section describes the preparation of a standard curve for duplicate measurements (recommended).

10.1 Reconstitution of the Lactoferrin Standard vial to generate an 40 ng/mL Stock Standard.

10.1.1 First consult the Lactoferrin Standard vial to determine the mass of protein in the vial.

Calculate the appropriate volume of 1X Diluent N to add when resuspending the Lactoferrin Standard vial to produce an 40 ng/mL Lactoferrin Stock Standard by using the following equation:

\[ C_S = \text{Starting mass of Lactoferrin Standard (see vial label) (ng)} \]
\[ C_F = \text{The 40 ng/mL Lactoferrin Stock Standard final required concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution (µL)} \]

Calculate total required volume 1X Diluent N for resuspension:

\[ \left( \frac{C_S}{C_F} \right) \times 1,000 = V_D \]

Example:

NOTE: This example is for demonstration purposes only. Please remember to check your standard vial for the actual amount of standard provided.

\[ C_S = 140 \text{ ng of Lactoferrin Standard in vial} \]
\[ C_F = 40 \text{ ng/mL Lactoferrin Stock Standard final concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution} \]

\[ (140 \text{ ng} / 40 \text{ ng/mL}) \times 1,000 = 3,500 \mu L \]
10.1.2 First briefly centrifuge the Lactoferrin Standard Vial to collect the contents on the bottom of the tube.
10.1.3 Reconstitute the Lactoferrin Standard vial by adding the appropriate calculated amount $V_D$ of 1X Diluent N to the vial to generate the 80 ng/mL Lactoferrin Stock Standard. Mix gently and thoroughly.

10.2 Allow the reconstituted 40 ng/mL Lactoferrin Stock Standard to sit for 10 minutes with gentle agitation prior to making subsequent dilutions.

10.3 Label eight tubes #1 – 8.

10.4 Prepare the 20 ng/mL Standard #1 by adding 250 µL of the reconstituted 40 ng/mL Lactoferrin Stock Standard to 250 µL of 1X Diluent N and mix thoroughly.

10.5 Add 120 µL of 1X Diluent N to tubes #2 – 8

10.6 To prepare Standard #2, add 120 µL of the Standard #1 into tube #2 and mix gently.

10.7 To prepare Standard #3, add 120 µL of the Standard #2 into tube #3 and mix gently.

10.8 Using the table below as a guide, prepare subsequent serial dilutions. 1X Diluent N serves as the zero standard (0 ng/mL).

11. Sample Preparation

11.1 Plasma:
Collect plasma using one-tenth volume of 0.1 M sodium citrate as
an anticoagulant. Centrifuge samples at 3,000 x g for 10 minutes.
Dilute samples 1:50 into 1X Diluent N and assay. The undiluted
samples can be stored -20°C or below for up to 3 months. Avoid
repeated freeze-thaw cycles. (EDTA or Heparin can also be used
as anticoagulant).

11.2 Serum:
Samples should be collected into a serum separator tube. After
clot formation, centrifuge samples at 3,000 x g for 10 minutes and
remove serum. Dilute samples 1:50 into 1X Diluent N. The undiluted
samples can be stored at -20°C or below for up to 3 months.
Avoid repeated freeze-thaw cycles.

11.3 Cell Culture Supernatants:
Centrifuge cell culture media at 3000 x g for 10 minutes to remove
debris. Collect supernatants and assay. Store samples at -20°C.
Avoid repeated freeze-thaw cycles.

11.4 Urine:
Collect urine using sample pot. Centrifuge samples at 800 x g for
10 minutes and assay. If necessary, dilute samples within the
range of 1:1 - 1:4 into 1X Diluent N and assay. Store samples at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.5 Saliva:
Collect saliva to sample tube. Centrifuge samples at 800 x g for
10 minutes. Dilute samples 1:1,000 into 1X Diluent N and assay. The
undiluted samples can be stored at -20°C or below for up to
3 months. Avoid repeated freeze-thaw cycles.

11.6 Milk:
Centrifuge samples at 800 x g for 10 minutes. Dilute samples within
the range of 1:100,000 - 1:400,000 into Diluent N and assay. Store
samples at -20°C or below for up to 3 months. Avoid repeated
freeze-thaw cycles.
11.7 Cerebrospinal Fluid:
Collect cerebrospinal fluid using a sample pot. Centrifuge samples at 3,000 x g for 10 minutes. Dilute samples within the range of 1:10 - 1:40 into 1X Diluent N and assay. The undiluted samples can be stored at -80°C for up to 3 months. Avoid repeated freeze-thaw cycles.

Refer to Dilution Guidelines for further instruction.

</table>
12. Plate Preparation

- The 96 well plate strips included with this kit are supplied ready to use. It is not necessary to rinse the plate prior to adding reagents.
- Unused well plate strips should be returned to the plate packet and stored at 4°C.
- For statistical reasons, we recommend each sample should be assayed with a minimum of two replicates (duplicates).
- Well effects have not been observed with this assay. Contents of each well can be recorded on the template sheet included in the Resources section.

13. Assay Procedure

- Equilibrate all materials and prepared reagents to room temperature prior to use.
- We recommend that you assay all standards, controls and samples in duplicate.

13.1 Prepare all reagents, working standards and samples as instructed. Equilibrate reagents to room temperature before use. The assay is performed at room temperature (18-25°C).
13.2 Remove excess microplate strips from the plate frame and return them immediately to the foil pouch with desiccant inside. Reseal the pouch securely to minimize exposure to water vapor and store in a vacuum desiccator.
13.3 Add 50 μL of Lactoferrin Standard or sample per well. Cover wells with a sealing tape and incubate for two hours. Start the timer after the last sample addition.
13.4 Wash five times with 200 μL of 1X Wash Buffer manually. Invert the plate each time and decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid. If using a machine wash, six times with 300 μL of 1X Wash Buffer and then invert the plate, decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid.
13.5 Add 50 μL of 1X Biotinylated Lactoferrin Antibody to each well and incubate for one hour.
13.6 Wash microplate as described above.
13.7 Add 50 μL of 1X SP Conjugate to each well and incubate for 30 minutes. Turn on the microplate reader and set up the program in advance.

13.8 Wash microplate as described above.

13.9 Add 50 μL of Chromogen Substrate per well and incubate for about 10 minutes or till the optimal blue color density develops. Gently tap plate to ensure thorough mixing and break the bubbles in the well with pipette tip.

13.10 Add 50 μL of Stop Solution to each well. The color will change from blue to yellow.

13.11 Read the absorbance on a microplate reader at a wavelength of 450 nm immediately. If wavelength correction is available, subtract readings at 570 nm from those at 450 nm to correct optical imperfections. Otherwise, read the plate at 450 nm only. Please note that some unstable black particles may be generated at high concentration points after stopping the reaction for about 10 minutes, which will reduce the readings.

14. Calculations

14.1.1 Calculate the mean value of the duplicate or triplicate readings for each standard and sample.

14.1.2 To generate a standard curve, plot the graph using the standard concentrations on the x-axis and the corresponding mean 450 nm absorbance (OD) on the y-axis. The best-fit line can be determined by regression analysis using log-log or four-parameter logistic curve-fit.

14.1.3 Determine the unknown sample concentration from the Standard Curve and multiply the value by the dilution factor.
15. Typical Data

Typical standard curve – data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.

Figure 1. Example of Lactoferrin standard curve. The standard curve was prepared as described in Section 10. Raw data values are shown in the table. Background-subtracted data values (mean +/- SD) are graphed.
16. Typical Sample Values

SENSITIVITY –
The minimum detectable dose (MDD) of Lactoferrin is typically ~0.11 ng/ml.

PRECISION –

<table>
<thead>
<tr>
<th></th>
<th>Intra-assay Precision</th>
<th>Inter-Assay Precision</th>
</tr>
</thead>
<tbody>
<tr>
<td>CV (%)</td>
<td>7.2</td>
<td>9.2</td>

</tr>
<tr>
<td>Average Recovery (%)</td>
<td>102 %</td>
</tr>
</tbody>
</table>

LINEARITY OF DILUTION -
Linearity of dilution is determined based on interpolated values from the standard curve. Linearity of dilution defines a sample concentration interval in which interpolated target concentrations are directly proportional to sample dilution.

Plasma and serum samples were serially-diluted to test for linearity.

<table>
<thead>
<tr>

</tbody>
</table>
17. Assay Specificity

This kit recognizes Lactoferrin in plasma, serum, urine, saliva, milk, cerebrospinal fluid and cell culture supernatants.

REFERENCE VALUES –
Normal human Lactoferrin plasma levels range from 150 – 850 ng/mL.

18. Species Reactivity
