ab108917 – Urokinase type Plasminogen Activator Human ELISA Kit

Instructions for Use

For the quantitative measurement of Human Urokinase type Plasminogen Activator in plasma, serum, urine, milk, cell culture supernatants and tissue extracts.

This product is for research use only and is not intended for diagnostic use.

19. NOTES 23
1. BACKGROUND

Abcam’s Urokinase type Plasminogen Activator Human in vitro ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for the quantitative measurement of Urokinase type Plasminogen Activator in plasma, serum, urine, milk, cell culture supernatants and tissue extracts.

A Urokinase type Plasminogen Activator specific antibody has been precoated onto 96-well plates and blocked. Standards or test samples are added to the wells and subsequently a Urokinase type Plasminogen Activator specific biotinylated detection antibody is added and then followed by washing with wash buffer. Avidin-Biotin-Peroxidase Complex is added and unbound conjugates are washed away with wash buffer. TMB is then used to visualize HRP enzymatic reaction. TMB is catalyzed by HRP to produce a blue color product that changes into yellow after adding acidic stop solution. The density of yellow coloration is directly proportional to the amount of Urokinase type Plasminogen Activator captured in plate.

Urokinase type Plasminogen activator is a highly restricted serine protease that converts the zymogen Plasminogen to active plasmin, a broad-spectrum serine proteinase capable of degrading most of the major protein components of the extracellular matrix. Binding of Urokinase type Plasminogen Activator to its receptor and subsequent Urokinase type Plasminogen Activator mediated pericellular proteolysis are involved in many process including cell migration and tissue remodeling in angiogenesis, atherogenesis, tumor cell metastasis, and ovulation. A high level of Urokinase type Plasminogen Activator is a marker associated with a poor prognosis for aggressive breast cancer, aggressive prostate cancer, bladder cancer and gastric cancer.

This assay recognizes single chain, two-chain, and both receptor and PAI-bound Human Urokinase type Plasminogen Activator.
2. **ASSAY SUMMARY**

**Primary capture antibody**

Prepare all reagents, samples and standards as instructed.

**Sample**

Add standard or sample to each well used. Incubate at room temperature.

**Primary detector antibody**

Wash and add prepared biotin antibody to each well. Incubate at room temperature.

**Streptavidin Label**

Wash and add prepared Streptavidin-Peroxidase Conjugate. Incubate at room temperature.

**Substrate Colored product**

Add Chromogen Substrate to each well. Incubate at room temperature. Add Stop Solution to each well. Read immediately.
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at 4°C immediately upon receipt, apart from the SP Conjugate & Biotinylated Antibody, which should be stored at -20°C.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in sections 9 & 10.

5. **MATERIALS SUPPLIED**

6. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully utilize this assay:

- 1 Microplate reader capable of measuring absorbance at 450 nm.
- Precision pipettes to deliver 1 µL to 1 mL volumes.
- Adjustable 1-25 mL pipettes for reagent preparation.
- 100 mL and 1 liter graduated cylinders.
- Absorbent paper.
- Distilled or deionized water.
- Log-log graph paper or computer and software for ELISA data analysis.
- 7 tubes to prepare standard or sample dilutions.

7. **LIMITATIONS**

- Do not mix or substitute reagents or materials from other kit lots or vendors.
8. **TECHNICAL HINTS**

- Samples generating values higher than the highest standard should be further diluted in the appropriate sample dilution buffers.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps.
- Complete removal of all solutions and buffers during wash steps.
- **This kit is sold based on number of tests.** A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
9. **REAGENT PREPARATION**

Equilibrate all reagents to room temperature (18-25°C) prior to use. Prepare fresh reagents immediately prior to use. If crystals have formed in the concentrate, mix gently until the crystals have completely dissolved.

9.1 **1X Diluent N**

Dilute the 10X Diluent N Concentrate 1:10 with reagent grade water. Mix gently and thoroughly. *Store for up to 1 month at 4°C.*

9.2 **1X Wash Buffer**

Dilute the 20X Wash Buffer Concentrate 1:20 with reagent grade water. Mix gently and thoroughly.

9.3 **1X Biotinylated Urokinase type Plasminogen Activator Detector Antibody**

9.3.1 The stock Biotinylated Urokinase type Plasminogen Activator Antibody must be diluted with 1X Diluent N according to the label concentration to prepare 1X Biotinylated Urokinase type Plasminogen Activator Antibody for use in the assay procedure. Observe the label for the “X” concentration on the vial of Biotinylated Urokinase type Plasminogen Activator Antibody.

9.3.2 Calculate the necessary amount of 1X Diluent N to dilute the Biotinylated Urokinase type Plasminogen Activator Antibody to prepare a 1X Biotinylated Urokinase type Plasminogen Activator Antibody solution for use in the assay procedure according to how many wells you wish to use and the following calculation:
ASSAY PREPARATION

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Any remaining solution should be frozen at -20°C.

Where:

\(C_S\) = Starting concentration (X) of stock Biotinylated Urokinase type Plasminogen Activator Antibody (variable)

\(C_F\) = Final concentration (always = 1X) of 1X Biotinylated Urokinase type Plasminogen Activator Antibody solution for the assay procedure

\(V_T\) = Total required volume of 1X Biotinylated Urokinase type Plasminogen Activator Antibody solution for the assay procedure

\(V_A\) = Total volume of (X) stock Biotinylated Urokinase type Plasminogen Activator Antibody

\(V_D\) = Total volume of 1X Diluent N required to dilute (X) stock Biotinylated Urokinase type Plasminogen Activator Antibody to prepare 1X Biotinylated Urokinase type Plasminogen Activator solution for assay procedures

Calculate the volume of (X) stock Biotinylated Antibody required for the given number of desired wells:

\[
(C_F / C_S) \times V_T = V_A
\]

Calculate the final volume of 1X Diluent N required to prepare the 1X Biotinylated Urokinase type Plasminogen Activator Antibody:

\[
V_T - V_A = V_D
\]
Example:

NOTE: This example is for demonstration purposes only. Please remember to check your antibody vial for the actual concentration of antibody provided.

\[ C_S = 50X \text{ Biotinylated Urokinase type Plasminogen Activator Antibody stock} \]

\[ C_F = 1X \text{ Biotinylated Urokinase type Plasminogen Activator Antibody solution for use in the assay procedure} \]

\[ V_T = 3,520 \mu L \text{ (8 well strips or 64 wells)} \]

\[
(1X/50X) \times 3,520 \mu L = 70.4 \mu L \\
3,520 \mu L - 70.4 \mu L = 3,449.6 \mu L
\]

\[ V_A = 70.4 \mu L \text{ total volume of (X) stock Biotinylated Urokinase type Plasminogen Activator Antibody required} \]

\[ V_D = 3,449.6 \mu L \text{ total volume of 1X Diluent N required to dilute the 50X stock Biotinylated Antibody to prepare 1X Biotinylated Urokinase type Plasminogen Activator Antibody solution for assay procedures} \]

9.3.3 First spin the Biotinylated Urokinase type Plasminogen Activator Antibody vial to collect the contents at the bottom.

9.3.4 Add calculated amount \( V_A \) of stock Biotinylated Urokinase type Plasminogen Activator Antibody to the calculated amount \( V_D \) of 1X Diluent N. Mix gently and thoroughly.

9.4 1X SP Conjugate

Spin down the 100X Streptavidin-Peroxidase Conjugate (SP Conjugate) briefly and dilute the desired amount of the conjugate 1:100 with 1X Diluent N.

*Any remaining solution should be frozen at -20°C.*
10. STANDARD PREPARATIONS

- Prepare serially diluted standards immediately prior to use. Always prepare a fresh set of standards for every use.
- Any remaining standard should be stored at -20°C after reconstitution and used within 30 days.
- This procedure prepares sufficient standard dilutions for duplicate wells.

10.1 Reconstitution of the Urokinase type Plasminogen Activator Standard vial to prepare a 16 ng/mL Urokinase type Plasminogen Activator Stock Standard.

10.1.1 First consult the Urokinase type Plasminogen Activator Standard vial to determine the mass of protein in the vial.

10.1.2 Calculate the appropriate volume of 1X Diluent N to add when resuspending the Urokinase type Plasminogen Activator Standard vial to produce a 16 ng/mL Urokinase type Plasminogen Activator Stock Standard by using the following equation:

\[ C_S = \text{Starting mass of Urokinase type Plasminogen Activator Standard (see vial label) (ng)} \]
\[ C_F = \text{The 16 ng/mL Urokinase type Plasminogen Activator Stock Standard final required concentration} \]
\[ V_D = \text{Required volume of 1X Diluent N for reconstitution (µL)} \]

Calculate total required volume 1X Diluent N for resuspension:

\[ (C_S / C_F) \times 1,000 = V_D \]
Example:

NOTE: This example is for demonstration purposes only. Please remember to check your standard vial for the actual amount of standard provided.

\[ C_S = 48 \text{ ng of Urokinase type Plasminogen Activator Standard in vial} \]

\[ C_F = 16 \text{ ng/mL Urokinase type Plasminogen Activator Stock Standard final concentration} \]

\[ V_D = \text{Required volume of 1X Diluent N for reconstitution} \]

\[ (48 \text{ ng} / 16 \text{ ng/mL}) \times 1,000 = 3,000 \mu L \]

10.1.3 First briefly spin the Urokinase type Plasminogen Activator Standard Vial to collect the contents on the bottom of the tube.

10.1.4 Reconstitute the Urokinase type Plasminogen Activator Standard vial by adding the appropriate calculated amount \( V_D \) of 1X Diluent N to the vial to generate the 16 ng/mL Urokinase type Plasminogen Activator Stock Standard. Mix gently and thoroughly.

10.2 Allow the reconstituted 16 ng/mL Urokinase type Plasminogen Activator Stock Standard to sit for 10 minutes with gentle agitation prior to making subsequent dilutions.

10.3 Label seven tubes #1 – 7.

10.4 Prepare the 8 ng/mL Standard #1 by adding 250 \( \mu L \) of the reconstituted 16 ng/mL Urokinase type Plasminogen Activator Stock Standard to 250 \( \mu L \) of 1X Diluent N and mix thoroughly and gently.

10.5 Add 120 \( \mu L \) of 1X Diluent N to tubes #2 – 7.

10.6 To prepare Standard #2, add 120 \( \mu L \) of the Standard #1 into tube #2 and mix gently.
10.7 To prepare **Standard #3**, add 120 μL of the **Standard #2** into tube #3 and mix gently.

10.8 Using the table below as a guide, prepare subsequent serial dilutions.

10.9 1X Diluent N serves as the zero standard, 0 ng/mL (tube #7).

11. SAMPLE PREPARATION

11.1 Plasma
Collect plasma using one-tenth volume of 0.1 M sodium citrate as an anticoagulant. Centrifuge samples at 3,000 x g for 10 minutes and use supernatants. Dilute samples 1:2 with 1X Diluent N and assay. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles. (EDTA or Heparin can also be used as an anticoagulant.).

11.2 Serum
Samples should be collected into a serum separator tube. After clot formation, centrifuge samples at 3,000 x g for 10 minutes and remove serum. Dilute samples 1:2 into 1X Diluent N. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.3 Cell Culture Supernatants
Centrifuge cell culture media at 1500 rpm for 10 minutes at 4°C to remove debris. Collect supernatants and assay. Store samples at -80°C. Avoid repeated freeze-thaw cycles.

11.4 Urine
Collect urine using sample pot. Centrifuge samples at 800 x g for 10 minutes. Dilute samples 1:20 into 1X Diluent N and assay. The undiluted samples can be stored at -20°C or below for up to 3 months. Avoid repeated freeze-thaw cycles.

11.5 Tissue
Extract tissue samples with 0.1 M phosphate-buffered saline (pH 7.4) containing 1% Triton X-100 and centrifuge at 14,000 x g for 30 minutes. Collect the supernatant and measure the protein concentration. Dilute the tissue extract 1:2 into 1X Diluent N and assay. The undiluted samples can be stored at -80°C. Avoid repeated freeze-thaw cycles.
11.6 Milk

Collect milk using sample tube. Centrifuge samples at 800 x g for 10 minutes and assay. Store samples at -20°C or below. Avoid repeated freeze-thaw cycles.

12. PLATE PREPARATION

- The 96 well plate strips included with this kit are supplied ready to use. It is not necessary to rinse the plate prior to adding reagents.
- Unused well plate strips should be returned to the plate packet and stored at 4°C.
- For statistical reasons, we recommend each sample should be assayed with a minimum of two replicates (duplicates).
- Well effects have not been observed with this assay. Contents of each well can be recorded on the template sheet included in the Resources section.
13. ASSAY PROCEDURE

- Equilibrate all materials and prepared reagents to room temperature (18 - 25°C) prior to use.
- It is recommended to assay all standards, controls and samples in duplicate.

13.1 Prepare all reagents, working standards and samples as instructed. Equilibrate reagents to room temperature before use. The assay is performed at room temperature (18-25°C).

13.2 Remove excess microplate strips from the plate frame and return them immediately to the foil pouch with desiccant inside. Reseal the pouch securely to minimize exposure to water vapor and store in a vacuum desiccator.

13.3 Add 50 μL of Urokinase type Plasminogen Activator standard or sample per well. Cover wells with a sealing tape and incubate for two hours. Start the timer after the last sample addition.

13.4 Wash five times with 200 μL of 1X Wash Buffer manually. Invert the plate each time and decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid. If using a machine wash six times with 300 μL of 1X Wash Buffer and then invert the plate, decant the contents; tap it 4-5 times on absorbent paper towel to completely remove the liquid.

13.5 Add 50 μL of 1X Biotinylated Urokinase type Plasminogen Activator Antibody to each well and incubate for one hour.

13.6 Wash microplate as described above.

13.7 Add 50 μL of 1X SP Conjugate to each well and incubate for 30 minutes. Turn on the microplate reader and set up the program in advance.

13.8 Wash microplate as described above.
13.9  Add 50 μL of Chromogen Substrate per well and incubate for about 20 minutes or till the optimal blue colour density develops. Gently tap plate to ensure thorough mixing and break the bubbles in the well with pipette tip.

13.10 Add 50 μL of Stop Solution to each well. The color will change from blue to yellow.

13.11 Read the absorbance on a microplate reader at a wavelength of 450 nm immediately. If wavelength correction is available, subtract readings at 570 nm from those at 450 nm to correct optical imperfections. Otherwise, read the plate at 450 nm only. Please note that some unstable black particles may be generated at high concentration points after stopping the reaction for about 10 minutes, which will reduce the readings.
14. **CALCULATIONS**

Calculate the mean value of the triplicate readings for each standard and sample. To generate a Standard Curve, plot the graph using the standard concentrations on the x-axis and the corresponding mean 450 nm absorbance on the y-axis. The best-fit line can be determined by regression analysis using log-log or four-parameter logistic curve-fit. Determine the unknown sample concentration from the Standard Curve and multiply the value by the dilution factor.
15. **TYPICAL DATA**

**TYPICAL STANDARD CURVE** – Data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.

![Typical Standard Curve](image_url)
16. TYPICAL SAMPLE VALUES

SENSITIVITY –
The minimum detectable dose of Urokinase type Plasminogen Activator is typically 0.18 ng/mL.

RECOVERY –
Standard Added Value: 0.25 – 2 ng/mL
Recovery %: 88 – 110.
Average Recovery %: 97

LINEARITY OF DILUTION –
