ab178628 – Anti-SS-A IgG ELISA Kit

Instructions for Use

For the quantitative measurement of IgG class antibodies against SS-A in Human serum and plasma.

This product is for research use only and is not intended for diagnostic use.

1. BACKGROUND

Abcam’s anti-SS-A IgG Human **in vitro** ELISA (Enzyme-Linked Immunosorbent Assay) kit is designed for the accurate quantitative measurement of IgG class antibodies against SS-A in Human serum and plasma.

A 96-well plate has been precoated with SS-A antigens to bind cognate antibodies. Controls or test samples are added to the wells and incubated. Following washing, a horseradish peroxidase (HRP) labelled anti-Human IgG conjugate is added to the wells, which binds to the immobilized SS-A-specific antibodies. TMB is then catalyzed by the HRP to produce a blue color product that changes to yellow after adding an acidic stop solution. The density of yellow coloration is directly proportional to the amount of SS-A IgG sample captured in plate.

The SS-A/Ro antigens are nuclear and cytoplasmic polypeptides which serve as autoantigens in systemic lupus erythematosus (SLE) and Sjögren's syndrome (SS). They contain two major isoforms of 60 and 52 kD. The former is the native antigen while the latter is a major autoantigen in its denatured form. The clinical relevance of anti SS-A/Ro antibodies in rheumatic diseases has also been considered. Initially these antibodies were thought to be an epiphenomenon of autoimmune diseases. Recent studies have shown that they are associated with specific clinical manifestations and disease subsets. Furthermore, animal models have demonstrated that they may enhance tissue damage. It seems that anti-SS-A/Ro antibodies may play a role in the pathogenicity of SLE and SS. Sjögren's syndrome is a chronic inflammatory autoimmune disease, characterized by destruction of exocrine glands (minor salivary glands, lacrimal glands, parotid) mediated by T lymphocytes. It has a frequency of 1% and it mainly affects women (9:1) from 50 years, it seems to be associated with a genetic predisposition related to HLA-DRw52 (which increases the risk of developing disease by a factor of 20) and HLA DR3 genes and probably to viral infection by EBV and HTLV-1. SS also produces an excessive activation of B cells with production of autoantibodies such as rheumatoid factor (RF), anti-SS-A/Ro, anti-SS-B/La. In
patients with SS they present in up to 60% of patients when tested by immunodiffusion and up to 90% when tested by ELISA, and are associated with more frequent extraglandular involvement. They may also be present in approximately 30% of patients with SLE. Patients presenting high titers in ELISA, especially for anti-Ro 52, are a risk factor for neonatal lupus.
2. **ASSAY SUMMARY**

Prepare all reagents, samples and controls as instructed.

Add samples and controls to wells used. Incubate at 37ºC.

Wash each well and add prepared labeled HRP-Conjugate. Incubate at room temperature.

After washing, add TMB substrate solution to each well. Incubate at room temperature. Add Stop Solution to each well. Read immediately.
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

All kit components have been formulated and quality control tested to function successfully as a kit. Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at 2-8°C immediately upon receipt.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in section 9. Reagent Preparation.

5. **MATERIALS SUPPLIED**

6. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully utilize this assay:

- Microplate reader capable of measuring absorbance at 450 nm or 620 nm
- Incubator at 37°C
- Multi and single channel pipettes to deliver volumes between 10 and 1,000 µL
- Optional: Automatic plate washer for rinsing wells
- Vortex tube mixer
- Deionised or (freshly) distilled water
- Disposable tubes
- Timer

7. **LIMITATIONS**

- ELISA kit intended for research use only. Not for use in diagnostic procedures
- All components of Human origin used for the production of these reagents have been tested for **anti-HIV antibodies, anti-HCV antibodies and HBsAg** and have been found to be non-reactive. Nevertheless, all materials should still be regarded and handled as potentially infectious
- Use only clean pipette tips, dispensers, and lab ware.
- Do not interchange screw caps of reagent vials to avoid cross-contamination
- Close reagent vials tightly immediately after use to avoid evaporation and microbial contamination
- After first opening and subsequent storage check conjugate and control vials for microbial contamination prior to further use
GENERAL INFORMATION

- To avoid cross-contamination and falsely elevated results pipette patient samples and dispense conjugate without splashing accurately to the bottom of wells

8. TECHNICAL HINTS

- Avoid foaming or bubbles when mixing or reconstituting components
- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps
- Complete removal of all solutions and buffers during wash steps is necessary for accurate measurement readings
- This kit is sold based on number of tests. A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions
9. **REAGENT PREPARATION**

Equilibrate all reagents, samples and controls to room temperature (18-25°C) prior to use.

9.1 **1X Washing Solution**

Prepare 1X Washing Solution by diluting 10X Washing Solution with deionized water. To make 500 mL 1X Washing Solution combine 50 mL 10X Washing Solution with 450 mL deionized water. Mix thoroughly and gently.

- All other solutions are supplied ready to use

10. **SAMPLE COLLECTION AND STORAGE**

- Use Human serum or plasma samples with this assay. If the assay is performed within 5 days of sample collection, the specimen should be kept at 2-8°C; otherwise they should be aliquoted and stored deep-frozen (-20 to -80°C). If samples are stored frozen, mix thawed samples well before testing. *Avoid repeated freezing and thawing.*

Heat inactivation of samples is not recommended

11. **SAMPLE PREPARATION**

- Before assaying, all samples should be diluted 1:100 with IgG Sample Diluent. Add 10 µL sample to 990 µL IgG Sample Diluent to obtain a 1:100 dilution. Mix gently and thoroughly.
12. **PLATE PREPARATION**

- The 96 well plate strips included with this kit are supplied ready to use. It is not necessary to rinse the plate prior to adding reagents.
- Unused well strips should be returned to the plate packet and stored at 4°C.
- For each assay performed, a minimum of 1 well must be used as a blank, omitting sample and conjugate from well addition.
- For statistical reasons, we recommend each standard and sample should be assayed with a minimum of two replicates (duplicates).
13. ASSAY PROCEDURE

- Equilibrate all materials and prepared reagents to room temperature prior to use.

- Please read the test protocol carefully before performing the assay. Reliability of results depends on strict adherence to the test protocol as described.

- If performing the test on ELISA automatic systems we recommend increasing the washing steps from three to five and the volume of washing solution from 300 µL to 350 µL to avoid washing effects.

- Assay all standards, controls and samples in duplicate.

13.1. Prepare all reagents, working standards, and samples as directed in the previous sections.

13.2. Remove excess microplate strips from the plate frame, return them to the foil pouch containing the desiccant pack, reseal and return to 4°C storage.

13.3. Add 100 µL of each standard or sample into appropriate wells. Leave one well for substrate blank.

13.4. Cover wells with the foil supplied in the kit and incubate for 1 hour at 37°C.

13.5. Remove the foil, aspirate the contents of the wells and wash each well three times with 300 µL of 1X Washing Solution. Avoid spill over into neighboring wells. The soak time between each wash cycle should be >5 sec. After the last wash, remove the remaining 1X Washing Solution by aspiration or decanting. Invert the plate and blot it against clean paper towels to remove excess liquid.

**Note:** Complete removal of liquid at each step is essential for good assay performance.

13.6. Add 100 µL RNP / SM Anti-IgG HRP Conjugate into all wells except for the blank well. Cover with foil.

13.7. Incubate for 30 minutes at room temperature. Do not expose to direct sunlight.
13.8. Repeat step 13.5.

13.9. Add 100 µL TMB Substrate Solution into all wells

13.10. Incubate for exactly 15 minutes at room temperature in the dark.

13.11. Add 100 µL Stop Solution into all wells in the same order and at the same rate as for the TMB Substrate Solution.

   Note: Any blue color developed during the incubation turns into yellow.

13.12. Highly positive samples can cause dark precipitates of the chromogen. These precipitates have an influence when reading the optical density. Predilution of the sample with PBS for example 1:1 is recommended. Then dilute the sample 1:100 with IgG Sample Diluent and multiply the results in Standard Units by 2 (See Section 14. Calculations.)

13.13. Measure the absorbance of the specimen at 450 nm within 30 minutes of addition of the Stop Solution.

   *Dual wavelength reading using 620 nm as reference wavelength is recommended.*
14. **CALCULATIONS**

**Calculation of Results**

Calculate the mean background subtracted absorbance for each point of the standard curve and each sample. Plot the mean value of absorbance of the standards against concentration. Draw the best-fit curve through the plotted points. (e.g.: Four Parameter Logistic).

Interpolate the values of the samples on the standard curve to obtain the corresponding values of the concentrations expressed in U/mL.

**Interpretation of Results**

Normal value ranges for this ELISA should be established by each researcher.

The following values should be considered as a guideline only:

- **Reactive** > 20 U/mL
- **Non reactive:** < 20 U/mL
15. TYPICAL DATA

TYPICAL STANDARD CURVE – Data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.

17. **ASSAY ANALYTICAL SPECS**

**SPECIFICITY -**

The specificity is 94.6 % and is defined as the probability of the assay scoring negative in the absence of the specific analyte.

**SENSITIVITY -**

The sensitivity is 94.3% and is defined as the probability of the assay scoring positive in the presence of the specific analyte.

The concentration of the analyte that can be distinguished from the zero standard is <0.14 U/mL.
## 18. TROUBLESHOOTING
