INTRODUCTION

1. BACKGROUND

Factor VIIIa Activity Assay Kit (Fluorometric) (ab204696) is based on the ability of FVIIIa to generate FXa. The generated FXa proteolytically cleaves a synthetic substrate and releases a fluorophore, AMC, which can be easily quantified by fluorescence microplate reader. The assay is simple, rapid and can detect activity as low as 1 ng of FVIIIa in a variety of samples.

![Diagram]

The coagulation Factor VIII, also known as anti-hemophilic factor (AHF) is a vital blood-clotting protein. Factor VIII circulates in the bloodstream as an inactive protein, bound to a large multimeric glycoprotein called von Willebrand factor (VWF). Upon an injury to the blood vessel, VWF dissociates from FVIII and releases the active form of FVIII (FVIIIa). In the presence of calcium ions and negatively charged membrane phospholipids, activated factor VIII (FVIIIa) then binds to the activated Factor IX (FIXa) and proteolytically activates factor X (FX) to factor Xa (FXa).
2. **ASSAY SUMMARY**

Standard Curve Preparation

↓

Sample Preparation

↓

Add Reaction Mix

↓

Measure Optical Density (Ex/Em = 360/450 nm) in a kinetic mode at 37°C for 30-60 minutes**

*For kinetic mode detection, incubation time given in this summary is for guidance only.*
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

All kit components have been formulated and quality control tested to function successfully as a kit. Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at -20°C in the dark immediately upon receipt. Kit has a storage time of 1 year from receipt, providing components have not been reconstituted.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in Materials Supplied section.

Aliquot components in working volumes before storing at the recommended temperature. **Reconstituted components are stable for 2 months.**

5. **LIMITATIONS**

- Assay kit intended for research use only. Not for use in diagnostic procedures.
- Do not mix or substitute reagents or materials from other kit lots or vendors. Kits are QC tested as a set of components and performance cannot be guaranteed if utilized separately or substituted.
6. **MATERIALS SUPPLIED**

7. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully perform this assay:

- Microcentrifuge
- Vortex
- Pipettes and pipette tips
- Fluorescent microplate reader – equipped with filter Ex/Em = 360/450 nm
- 96 well plate with clear flat bottom preferably white
- Heat block or water bath
8. **TECHNICAL HINTS**

- This kit is sold based on number of tests. A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or standard will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
- Selected components in this kit are supplied in surplus amount to account for additional dilutions, evaporation, or instrumentation settings where higher volumes are required. They should be disposed of in accordance with established safety procedures.
- Keep enzymes, heat labile components and samples on ice during the assay.
- Make sure all buffers and solutions are at room temperature before starting the experiment.
- Samples generating values higher than the highest standard should be further diluted in the appropriate sample dilution buffers.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Avoid cross contamination of samples or reagents by changing tips between sample, standard and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps.
- Make sure you have the right type of plate for your detection method of choice.
- Make sure the heat block/water bath and microplate reader are switched on.
9. **REAGENT PREPARATION**

- Briefly centrifuge small vials at low speed prior to opening.

  9.1 **FVIIIa Assay Buffer:**
  Ready to use as supplied. Equilibrate to room temperature before use. Store at -20°C.

  9.2 **Enzyme Mix I:**
  Reconstitute in 220 µL FVIIIa Assay Buffer. Mix well by pipetting up and down, and briefly centrifuge the vial. Aliquot enzyme so that you have enough volume to perform the desired number of assays. Store at -20°C. Avoid repeated freeze/thaw. Keep on ice while in use.

  9.3 **Enzyme Mix II:**
  Reconstitute in 220 µL FVIIIa Assay Buffer. Mix well by pipetting up and down, and briefly centrifuge the vial. Aliquot enzyme so that you have enough volume to perform the desired number of assays. Avoid repeated freeze/thaw. Store at -80°C. Keep on ice while in use.

  9.4 **Phospholipid Vesicles:**
  Vortex for 10 seconds before each use. Phospholipids can be stored at 4°C for one month. For long term storage -20°C is recommended. Avoid repeated freeze/thaw.

  9.5 **FVIIIa Enzyme Standard (2.6 µg):**
  Reconstitute in 52 µL FVIIIa Assay Buffer to prepare a stock solution of 50 ng/µL. Mix well by pipetting up and down. Aliquot reconstituted standard so that you have enough volume to perform the desired number of assays. Avoid repeated freeze/thaw. Store at -80°C.

  9.6 **FXa Substrate-AMC:**
  Ready to use as supplied. Aliquot substrate so that you have enough volume to perform the desired number of assays. Avoid repeated freeze/thaw. Store at -20°C.
10. **STANDARD PREPARATION**

- Always prepare a fresh set of standards for every use.
- Diluted FVIIIa Standard solution can be stored at -80°C for future use. Use within a week.

10.1 Prepare 200 µL of 0.5 ng/µL FVIIIa Enzyme Standard by diluting 2 µL of the provided FVIIIa Enzyme stock solution (50 ng/µL) with 198 µL of FVIIIa Assay Buffer.

10.2 Using 0.5 ng/µL FVIIIa Enzyme Standard, prepare standard curve dilution as described in the table in a microplate or microcentrifuge tubes.

Each dilution has enough amount of standard to set up duplicate readings (2 x 10 µL).
11. **SAMPLE PREPARATION**

**General Sample information:**

- We recommend performing several dilutions of your sample to ensure the readings are within the standard value range.
- We recommend that you use fresh samples. Alternatively, if that is not possible, we suggest that you snap your samples in liquid nitrogen upon extraction and store the samples immediately at -80°C. When you are ready to test your samples, thaw them on ice. Be aware however that this might affect the stability of your samples and the readings can be lower than expected.

11.1 **Plasma and Serum:**

Dilute plasma and serum samples 10X with FVIIIa Assay Buffer before adding sample to microplate wells.

However, to find the optimal values and ensure your readings will fall within the standard values, we recommend performing several dilutions of the sample.

11.2 **Purified enzyme:**

Dilute purified enzyme in FVIIIa Assay Buffer to a final range of 0.1 – 0.4 ng/µL.

However, to find the optimal values and ensure your readings will fall within the standard values, we recommend performing several dilutions of the sample.

**NOTE:** We suggest using different dilutions of sample to ensure readings are within the Standard Curve range.
12. ASSAY PROCEDURE and DETECTION

- Equilibrate all materials and prepared reagents to room temperature prior to use.
- It is recommended to assay all standards, controls and samples in duplicate.
- Prepare all reagents, working standards, and samples as directed in the previous sections.

12.1 Set up Reaction wells:
- Standard wells = 10 µL standard dilutions.
- Sample wells = 2 – 5 µL samples (adjust volume to 10 µL/well with FVIIIa Assay Buffer).
- Background control sample wells= 2 - 5 µL samples (adjust volume to 10 µL/well FVIIIa Assay Buffer).

12.2 Reaction Mix:
Prepare 10 µL of Reaction Mix for each reaction:

<table>
<thead>
<tr>
<th>Component</th>
<th>Reaction Mix (µL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enzyme Mix I</td>
<td>2</td>
</tr>
<tr>
<td>Phospholipids</td>
<td>6</td>
</tr>
<tr>
<td>Enzyme Mix II</td>
<td>2</td>
</tr>
</tbody>
</table>

Mix enough reagents for the number of assays (samples and controls) to be performed. Prepare a master mix of the Reaction Mix to ensure consistency. We recommend the following calculation: X µL component x (Number reactions +1)

12.3 Add 10 µL of Reaction Mix into each standard and sample well. Mix well.

12.4 Add 10 µL of FVIIIa Assay Buffer to all background control well(s). Mix well.

12.5 Adjust the volume to 98 µL/well with FVIIIa Assay Buffer. Mix well.

12.6 Incubate for 15 minutes at 37°C.
12.7 Add 2 μL of FXa substrate-AMC into all wells (standard, background control and sample wells). Mix well.

12.8 Measure output on a fluorescent microplate reader at Ex/Em = 360/450 nm in a kinetic mode, every 2 – 3 minutes, for 30 – 60 minutes at 37°C protected from light.

**NOTE:** Sample incubation time can vary depending on FVIIIa activity in the samples. We recommend measuring fluorescence in kinetic mode and then choosing two time points (T₁ and T₂) during the linear range.

RFU value at T₂ should not exceed the highest RFU in the standard curve. For standard curve, do not subtract RFU₁ from RFU₂ reading.
13. **CALCULATIONS**

- Samples producing signals greater than that of the highest standard should be further diluted in appropriate buffer and reanalyzed, then multiplying the concentration found by the appropriate dilution factor.
- For statistical reasons, we recommend each sample should be assayed with a minimum of two replicates (duplicates).

13.1 Average the duplicate reading for each standard and sample.

13.2 If the sample background control is significant, then subtract the sample background control from sample reading.

13.3 Subtract the mean absorbance value of the blank (Standard #1) from all standard and sample readings. This is the corrected absorbance.

13.4 Plot the corrected absorbance values for each standard as a function of the final concentration of FVIIIa Enzyme.

13.5 Draw the best smooth curve through these points to construct the standard curve. Calculate the trend line equation based on your standard curve data (use the equation that provides the most accurate fit).

13.6 Activity of FVIIIa is calculated as:

$$\Delta RFU_{360/450nm} = (RFU_2 - RFU_{2BG}) - (RFU_1 - RFU_{1BG})$$

Where:

- RFU_1 is the sample reading at time T_1.
- RFU_{1BG} is the background control sample at time T_1.
- RFU_2 is the sample reading at time T_2.
- RFU_{2BG} is the background control sample at time T_2.

13.7 Use the $\Delta RFU_{360/450nm}$ to obtain B (in ng) of Factor VIIIa.
13.8 Activity of Factor VIIIa in the test is calculated as:

\[
FVIIIa \text{ Activity} = \left( \frac{B}{V} \right) \times \text{Dilution Factor} = \text{ng/mL} = \mu g/L
\]

Where:

B = Amount of FVIIIa from Standard Curve (ng).

V = Original sample volume added into the reaction well (in mL).
14. **TYPICAL DATA**

**TYPICAL STANDARD CURVE** – Data provided for demonstration purposes only. A new standard curve must be generated for each assay performed.

![Figure 1](image1.png)

**Figure 1** Typical FVIIa Standard calibration curve using fluorometric reading.

![Figure 2](image2.png)

**Figure 2.** Factor VIIIa activity was measured in serum samples in the presence and absence of the master mix. S: Substrate.
15. **QUICK ASSAY PROCEDURE**

*NOTE*: This procedure is provided as a quick reference for experienced users. Follow the detailed procedure when performing the assay for the first time.

- Prepare standard and prepare enzyme mix; get equipment ready.
- Prepare appropriate standard curve.
- Prepare samples in duplicate (find optimal dilutions to fit standard curve readings).
- Set up plate for standard (10 µL), samples (10 µL) and background wells (10 µL).
- Prepare Factor VIII Reaction Mix (Number reactions + 1).

<table>
<thead>

</tr>
</tbody>
</table>

- Add 10 µL of Factor VIII Reaction Mix to the standard, sample wells.
- Add 10 µL of FVIIIa Assay Buffer to background control wells.
- Adjust the volume to 98 µL/well with FVIIIa Assay Buffer. Mix well.
- Incubate for 15 minutes at 37°C.
- Add 2 µL of FXa substrate-AMC into Standard, background control and sample wells. Mix well.
- Incubate plate at 37°C during 30-60 minutes and read fluorescence at Ex/Em= 360/450 nm in a kinetic mode.
## 16. TROUBLESHOOTING

17. **INTERFERENCES**

These chemicals or biological materials will cause interferences in this assay causing compromised results or complete failure.

- RIPA buffer – it contains SDS which can destroy/decrease the activity of the enzyme.
