COVID-19 S-Protein (S1RBD) Human IgA ELISA Kit

View ab276185 COVID-19 S-Protein (S1RBD) Human IgA ELISA Kit datasheet: www.abcam.com/ab276185
(use www.abcam.cn/ab276185 for China, or www.abcam.co.jp/ab276185 for Japan)

For the quantitative measurement of human IgA antibody against SARS-CoV-2 S1 RBD protein in human serum.

This product is for research use only and is not intended for diagnostic use.

1. Overview

COVID-19 S-Protein (S1RBD) Human IgA ELISA Kit (ab276185) is an *in vitro* indirect ELISA for the quantitative measurement of human IgA antibody against SARS-CoV-2 S1 RBD protein in human serum.

Standard 96-well plates (12 strips with 8 wells/strip) are coated with the SARS-CoV-2 S1 RBD protein, which combines with the corresponding antibody present in a sample and Positive control, which used as calibration curve for interpretation purposes. The wells are washed, and biotinylated anti-human IgA antibody is added. After washing away unbound biotinylated antibody, HRP-conjugated streptavidin is pipetted to the wells. The wells are again washed, a TMB substrate solution is added to the wells, and color develops in proportion to the amount of COVID-19 S1 RBD protein human IgA antibody bound. The Stop Solution changes the color from blue to yellow, and the intensity of the color is measured at 450 nm.

The Positive Controls are from an inactivated serum sample which contains SARS-COV-2 S1 RBD protein human IgA antibody. We do not know the exact amount of SARS-COV-2 S1 RBD protein human IgA antibody in the Positive Control sample. The Positive Control can be used as a calibration curve for interpretation purposes in different assays.
2. Protocol Summary

Prepare all reagents, samples, and positive control as instructed.

Add 100 μL positive control or sample to each well (SARS-CoV-2 S1 RBD coated plate and Albumin coated plate). Incubate 1 hours at room temperature.

Add 100 μL prepared biotin antibody to each well. Incubate 30 minutes at room temperature.

Add 100 μL prepared HRP-Streptavidin solution. Incubate 30 minutes at room temperature.

Add 100 μL TMB Substrate Solution to each well. Incubate 15 minutes at room temperature.

Add 50 μL Stop Solution to each well. Read at 450 nm immediately.
3. Precautions

Please read these instructions carefully prior to beginning the assay.

- All ELISA kit components have been formulated and quality control tested to function successfully as a kit.
- We understand that, occasionally, experimental protocols might need to be modified to meet unique experimental circumstances. However, we cannot guarantee the performance of the product outside the conditions detailed in this protocol booklet.
- Reagents should be treated as possible mutagens and should be handle with care and disposed of properly. Please review the Safety Datasheet (SDS) provided with the product for information on the specific components.
- Observe good laboratory practices. Gloves, lab coat, and protective eyewear should always be worn. Never pipette by mouth. Do not eat, drink or smoke in the laboratory areas.
- All biological materials should be treated as potentially hazardous and handled as such. They should be disposed of in accordance with established safety procedures.

4. Storage and Stability

The entire ELISA kit may be stored at -20°C for up to 1 year from the date of shipment. Avoid repeated freeze-thaw cycles. For extended storage, it is recommended to store at -80°C.

Observe the storage conditions for individual prepared components in the Reagent Preparation Section 9.
5. Limitations

- ELISA kit intended for research use only. Not for use in diagnostic procedures.
- Do not mix or substitute reagents or materials from other kit lots or vendors. Kits are QC tested as a set of components and performance cannot be guaranteed if utilized separately or substituted.

7. Materials Required, Not Supplied

These materials are not included in the kit, but will be required to successfully perform this assay:

- Microplate reader capable of measuring absorbance at 450 nm.
- Precision pipettes to deliver 2 µl to 1 ml volumes.
- Adjustable 1-25 ml pipettes for reagent preparation.
- 100 ml and 1 liter graduated cylinders.
- Absorbent paper.
- Distilled or deionized water.
- Tubes to prepare positive control or sample dilutions.

8. Technical Hints

- Samples generating values higher than the highest positive control should be further diluted in the appropriate sample dilution buffers.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Avoid cross contamination of samples or reagents by changing tips between sample, positive control and reagent additions.
- Ensure plates are properly sealed or covered during incubation steps.
- Complete removal of all solutions and buffers during wash steps is necessary to minimize background.
- All samples should be mixed thoroughly and gently.
- Avoid multiple freeze/thaw of samples.
- When generating positive control samples, it is advisable to change pipette tips after each step.
- This kit is sold based on number of tests. A ‘test’ simply refers to a single assay well. The number of wells that contain sample, control or positive control will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
9. Reagent Preparation

- Equilibrate all reagents to room temperature (18-25°C) prior to use. The kit contains enough reagents for 96 wells.
- Prepare only as much reagent as is needed on the day of the experiment.

9.1 5X Assay Diluent B:
Dilute 5X Assay Diluent B 5-fold with deionized or distilled water before use (the diluted solution can be stored at 4°C for 1 month).

9.2 5X Sample Diluent:
Dilute 5X Sample Diluent 5-fold with deionized or distilled water before use (the diluted solution can be stored at 4°C for 1 month).

9.3 Biotinylated anti-Human IgA Antibody:
Briefly spin. Add 200 μL of 1X Assay Diluent B into the vial to prepare a detection antibody concentrate. Pipette up and down to mix gently (the diluted solution can be stored at 4°C for 5 days). The detection antibody concentrate should be diluted 100-fold with 1X Assay Diluent B.

9.4 20X Wash Buffer:
If the Wash Concentrate (20X) contains visible crystals, warm to room temperature and mix gently until dissolved. Dilute 40 mL of Wash Buffer Concentrate into deionized or distilled water to yield 800 mL of 1X Wash Buffer.

9.5 HRP-Streptavidin Concentrate:
Briefly spin the vial of HRP-Streptavidin concentrate before use. HRP-Streptavidin should be diluted 800-fold with 1X Assay Diluent B (do not store and reuse the diluted).

For example: Briefly spin the vial and pipette up and down to mix gently. Add 25 μL of HRP-Streptavidin concentrate into a tube with 20 mL 1X Assay Diluent B to prepare a 800-fold diluted HRP-Streptavidin solution (don't store the diluted solution for next day use). Mix well.
10. Sample Preparation

- Equilibrate all reagents to room temperature (18-25°C) prior to use. The kit contains enough reagents for 96 wells.
- Prepare only as much sample as is needed on the day of the experiment.

10.1 Human serum:
Dilute sample with 1X Sample Diluent (prepared in step 9.2) 500 times. Mix the diluted sample well and evenly for the best results.
For example, add 1 μL serum + 499 μL 1X Sample Diluent.

⚠ Note: The user needs to calculate the amount of the sample used for the whole test. Please reserve sufficient amount of sample in advance.

⚠ Note: Avoid using samples with severe hemolysis, precipitate, contamination by bacteria or protein suspension.

⚠ Note: The use of EDTA, heparin sulfate, sodium citrate, or other anticoagulants will not affect the results.
11. Positive Control Preparation

- The Positive Control Stock Solution can be stored at -80ºC for 1 week.
- Always prepare a fresh set of Positive Controls for every use.
- Discard working dilutions after use as they do not store well.
- The following section describes the preparation of a Positive Control curve for duplicate measurements (recommended).

11.1 Briefly spin a Positive Control vial.
11.2 Add 400 µl 1X Sample Diluent into the vial to prepare a 1000 Unit/ml Positive Control solution. Dissolve the powder thoroughly by a gentle mix.
11.3 Pipette 320 µL 1X Sample Diluent into each of 7 tubes.
11.4 Use the 1000 Unit/ml Positive Control solution to produce a dilution series (shown below).
11.5 Mix each tube thoroughly before the next transfer.
11.6 1X Sample Diluent serves as the zero (0 Unit/ml).

12. Assay Procedure

- Equilibrate all materials and prepared reagents to room temperature prior to use.
- We recommend that you assay positive control and all samples in duplicate.
- Prepare all reagents, positive control, and samples as directed in the previous sections.

12.1 Label removable 8-well strips as appropriate for your experiment.
12.2 Add 100 μL of prepared Positive Control or Sample into appropriate wells of the SARS-CoV-2 S1RBD protein and the Albumin protein coated microplate strip. Cover the wells and incubate for 1 hour at room temperature with gentle shaking.
12.3 Discard the solution and wash 4 times with 1X Wash Solution. Wash by filling each well with Wash Buffer (300 μL) using a multi-channel Pipette or auto-washer. Complete removal of liquid at each step is essential for good performance. After the last wash, remove any remaining Wash Buffer by aspirating or decanting. Invert the plate and blot it against clean paper towels.
12.4 Add 100 μL of 1X prepared biotinylated antibody to each well. Incubate for 30 minutes at room temperature with gentle shaking.
12.5 Discard the solution. Repeat the wash as in step 12.3.
12.6 Add 100 μL of prepared Streptavidin solution each well. Incubate for 30 minutes at room temperature with gentle shaking.
12.7 Discard the solution. Repeat the wash as in step 12.3.
12.8 Add 100 μL of TMB One-Step Substrate Solution to each well. Incubate for 15 minutes at room temperature in the dark with gentle shaking.
12.9 Add 50 μL of Stop Solution to each well. Read at 450 nm immediately.
13. Calculations

13.1 Subtract the signals of all wells of the Albumin protein coated plate from the signals of all wells of the S1RBD coated plate, including positive control and samples, to remove the background.

13.2 Calculate the mean absorbance for each set of duplicate positive control and samples from the background subtracted S1RBD plate.

13.3 Subtract the average zero Positive Control optical density.

13.4 Plot the calibration curve on log-log, with Positive Control concentration (Units/mL) on the x-axis and absorbance on the y-axis using Sigma plot or Excel software.

13.5 A calibration curve must be run with each assay.
14. Typical Data

**Typical calibration curve** – data provided for demonstration purposes only. A new calibration curve must be generated for each assay performed.

![Calibration Curve](image)

**Figure 1.** COVID-19 S-Protein (S1RBD) Human IgA ELISA Kit (ab276185) Calibration curve.

**Human Serum**

A **positive result** for an unknown sample is considered as a Unit/ml calculated value using the calibration curve of greater than 21.4 Unit/ml.

A **negative result** for an unknown sample is considered as a Unit/ml calculated value using the calibration curve of less than 21.4 Unit/ml.

**Sensitivity:** Against a reference standard is 76.61% (95/124, 95%CI: 68.17-83.74%).

**Accuracy:** Against a reference standard is 91.38% (371/406, 95%CI: 88.21-93.92%), with Kappa value of 0.7857.

**Specificity:** Against a reference standard is 97.87% (276/282, 95%CI: 95.43-99.22%).
### 15. Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Reason</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Poor calibration curve</strong></td>
<td>Inaccurate Pipetting</td>
<td>Check pipettes</td>
</tr>
<tr>
<td></td>
<td>Improper calibration dilution</td>
<td>Prior to opening, briefly spin the stock positive control tube and dissolve the powder thoroughly by gentle mixing</td>
</tr>
<tr>
<td><strong>Low Signal</strong></td>
<td>Improper preparation of positive control and/or the HRP-conjugated antibodies</td>
<td>Briefly spin down vials before opening. Dissolve the powder thoroughly.</td>
</tr>
<tr>
<td></td>
<td>Too brief incubation times</td>
<td>Ensure sufficient incubation time. Sample and positive control addition may be done overnight at 4°C with gentle shaking (note: may increase overall signals including background).</td>
</tr>
<tr>
<td></td>
<td>Inadequate reagent volumes or improper dilution</td>
<td>Check pipettes and ensure correct preparation</td>
</tr>
<tr>
<td><strong>Large CV</strong></td>
<td>Inaccurate pipetting</td>
<td>Check pipettes</td>
</tr>
<tr>
<td></td>
<td>Air bubbles in wells</td>
<td>Remove bubbles in wells</td>
</tr>
<tr>
<td><strong>High background</strong></td>
<td>Plate is insufficiently washed</td>
<td>Review the manual for proper wash. If using a plate washer, ensure that all ports are unobstructed.</td>
</tr>
<tr>
<td></td>
<td>Contaminated wash buffer</td>
<td>Make fresh wash buffer</td>
</tr>
<tr>
<td><strong>Low sensitivity</strong></td>
<td>Improper storage of the ELISA kit</td>
<td>Store your Positive Control at &lt; - 70°C after reconstitution, others at 4°C. Keep substrate solution protected from light.</td>
</tr>
<tr>
<td></td>
<td>Stop solution</td>
<td>Add stop solution to each well before reading plate</td>
</tr>
