ab65306

Cathepsin L Activity Assay kit (Fluorometric)

Instructions for Use

For the rapid, sensitive and accurate measurement of Cathepsin L activity in various samples.

This product is for research use only and is not intended for diagnostic use.

INTRODUCTION

1. BACKGROUND

Cathepsin L Activity Assay Kit (colorimetric) (ab65306) is a fluorescence-based assay that utilizes the preferred cathepsin-L substrate sequence FR labeled with AFC (amino-4-trifluoromethyl coumarin). Cell lysates or other samples that contain cathepsin-L will cleave the synthetic substrate FR-AFC to release free AFC.

Apoptosis can be mediated by mechanisms other than the traditional caspase-mediated cleavage cascade. There is growing recognition that alternative proteolytic enzymes such as the lysosomal cathepsin proteases may initiate or propagate pro-apoptotic signals. Cathepsins are lysosomal enzymes that are also used as sensitive markers in various toxicological investigations.
2. **ASSAY SUMMARY**

- Lyse cells
- Add reaction buffer
- Add Ac-FR-AFC substrate, incubate at 37°C for 1-2 hrs
- Measure fluorescence (Ex/Em = 400/505 nm)
3. **PRECAUTIONS**

Please read these instructions carefully prior to beginning the assay.

All kit components have been formulated and quality control tested to function successfully as a kit. Modifications to the kit components or procedures may result in loss of performance.

4. **STORAGE AND STABILITY**

Store kit at -20°C in the dark immediately upon receipt. Kit has a storage time of 1 year from receipt, providing components have not been reconstituted.

Refer to list of materials supplied for storage conditions of individual components. Observe the storage conditions for individual prepared components in section 5.

Aliquot components in working volumes before storing at the recommended temperature. **Reconstituted components are stable for 6 months.**
5. **MATERIALS SUPPLIED**

6. **MATERIALS REQUIRED, NOT SUPPLIED**

These materials are not included in the kit, but will be required to successfully utilize this assay:

- PBS
- Microcentrifuge
- Pipettes and pipette tips
- Fluorescent microplate reader - equipped with filter for Ex/Em = 400/505 nm
- 96 well plate: black plates (clear bottoms) for fluorometric assay
- Orbital shaker
- Dounce homogenizer (if using tissue)
7. **LIMITATIONS**

- Assay kit intended for research use only. Not for use in diagnostic procedures.
- Do not use kit or components if it has exceeded the expiration date on the kit labels.
- Do not mix or substitute reagents or materials from other kit lots or vendors. Kits are QC tested as a set of components and performance cannot be guaranteed if utilized separately or substituted.

8. **TECHNICAL HINTS**

- This kit is sold based on number of tests. A ‘test’ simply refers to a single assay well. The number of wells that contain sample or control will vary by product. Review the protocol completely to confirm this kit meets your requirements. Please contact our Technical Support staff with any questions.
- Keep enzymes and heat labile components and samples on ice during the assay.
- Make sure all buffers and developing solutions are at room temperature before starting the experiment.
- Avoid cross contamination of samples or reagents by changing tips between sample and reagent additions.
- Avoid foaming or bubbles when mixing or reconstituting components.
- Ensure plates are properly sealed or covered during incubation steps.
- Ensure complete removal of all solutions and buffers from tubes or plates during wash steps.
- Make sure you have the appropriate type of plate for the detection method of choice.
• Make sure the heat block/water bath and microplate reader are switched on before starting the experiment.
9. REAGENT PREPARATION

- Briefly centrifuge small vials at low speed prior to opening.

9.1 CL Buffer:
Ready to use as supplied. Equilibrate to room temperature before use. Store at +4°C once opened.

9.2 DTT:
Ready to use as supplied. Aliquot DTT so that you have enough to perform the desired number of assays. Store at -20°C once opened.

9.3 Cathepsin L positive control:
Reconstitute with 25 µL CL Buffer. Aliquot positive control so that you have enough to perform the desired number of assays. Store at -20°C once opened.

9.4 CL Substrate Ac-FR-AFC (10 mM):
Ready to use as supplied. Aliquot substrate so that you have enough to perform the desired number of assays. Store at -20°C protected from light.

9.5 CL Inhibitor (1 mM):
Ready to use as supplied. Aliquot inhibitor so that you have enough to perform the desired number of assays. Store at -20°C.
10. **SAMPLE PREPARATION**

**General Sample information:**

- We recommend that you use fresh samples. If you cannot perform the assay at the same time, we suggest that you complete the Sample Preparation step before storing the samples. Alternatively, if that is not possible, we suggest that you snap freeze cells or tissue in liquid nitrogen upon extraction and store the samples immediately at -80°C. When you are ready to test your samples, thaw them on ice. Be aware however that this might affect the stability of your samples and the readings can be lower than expected.

- Fold-increase in Cathepsin L activity can be determined by comparing the relative fluorescence units (RFU) with the level of the untreated control or the negative control sample.

- If desired, the units of cathepsin L can be determined by generating a standard curve using free AFC under your assay conditions. Free AFC is available from Abcam as ab145587.

10.1 **Cell (adherent or suspension) samples:**

10.1.1 Harvest the amount of cells necessary for each assay (initial recommendation 1-5 x 10^6 cells).

10.1.2 Wash cells with cold PBS.

10.1.3 Lyse cells in 50 µL of chilled CL Buffer.

10.1.4 Incubate cells on ice for 10 minutes.

10.1.5 Centrifuge sample for 2 – 5 minutes at 4°C at top speed using a cold microcentrifuge to remove any insoluble material.

10.1.6 Collect supernatant and transfer to a clean tube.

10.1.7 Keep on ice.

10.2 **Tissue samples:**

10.2.1 Harvest the amount of tissue necessary for each assay (initial recommendation = 10 mg).
10.2.2 Wash tissue in cold PBS.
10.2.3 Resuspend tissue in 50 µL of CL Buffer.
10.2.4 Homogenize tissue with a Dounce homogenizer sitting on ice, with 10 – 15 passes.
10.2.5 Centrifuge samples for 2 – 5 minutes at 4°C at top speed using a cold microcentrifuge to remove any insoluble material.
10.2.6 Collect supernatant and transfer to a clean tube.
10.2.7 Keep on ice.
11. ASSAY PROCEDURE and DETECTION

- Equilibrate all materials and prepared reagents to room temperature prior to use.
- It is recommended to assay all controls and samples in duplicate.

11.1 Set up Reaction wells:
  - Treated sample wells = 50 µL sample.
  - Untreated sample wells = 50 µL sample.
  - Background control wells = 50 µL untreated sample only.
  - (Optional) Positive control = 5 µL reconstituted positive control + 45 µL CL Assay Buffer
  - (Optional) Negative control = 50 µL CL buffer.

11.2 Add 50 µL of CL Buffer to all sample and control wells.

11.3 Add 1 µL DTT to each well.

11.4 Add 2 µL 10 mM Ac-FR-AFC substrate (200 µM final concentration) to all sample wells, except Background control well(s).

11.5 (Optional) Add 2 µL Cathepsin L Inhibitor to negative control wells.

11.6 Mix and incubate at 37°C for 1 – 2 hours.

11.7 Measure output on a microplate reader.
  - Fluorometric assay: measure Ex/Em = 400/505 nm.
12. **CALCULATIONS**

- Fold-increase in Cathepsin L activity can be determined by comparing the relative fluorescence units (RFU) with the level of the uninduced control or the negative control sample.
13. TYPICAL DATA

Figure 1: Measurement of recombinant Human cathepsin L activity (ab81780).

Figure 2: Measurement of cathepsin L activity in HepG2 lysate.
Figure 3: Measurement of cathepsin L activity in untreated and treated (5 or 25 µM acetaldehyde) HepG2 lysates. Lysate without the addition of substrate was used as a background control. Free AFC was used to obtain AFC standard curve. The protein amount in lysate obtained after treatment with 25 µM of acetaldehyde was lower as compared to untreated or 5µM treated cells.
14. **QUICK ASSAY PROCEDURE**

**NOTE:** This procedure is provided as a quick reference for experienced users. Follow the detailed procedure when performing the assay for the first time.

- Prepare CL Buffer, DTT, substrate, positive control (optional) and inhibitor (optional); get equipment ready.
- Prepare samples in duplicate; (find optimal dilutions to fit standard curve readings).
- Set up plate for samples (50 µL), background control, positive and negative control wells (50 µL).
- Add 50 µL of CL Buffer to each sample and control wells.
- Add 1 µL DTT to each well.
- Add 2 µL 10 mM Ac-FR-AFC substrate to all wells (except background control).
- (Optional) Add 2 µL of Cathepsin L Inhibitor to negative control sample wells
- Mix and incubate at 37°C for 1 – 2 hrs.
- Measure plate at Ex/Em= 400/505 nm for fluorometric assay.
# Troubleshooting

16. **FAQs**

*How can I calculate the exact Cathepsin L levels in my samples with this kit?*

This is a relative assay which will just show the fold increase of Cathepsin L between your treated and untreated samples. To find the absolute levels of Cathepsin L in your sample, you will have to make a standard curve with free AFC.
