General Info

Function Produced by activated macrophages, IL-1 stimulates thymocyte proliferation by inducing IL-2

> release, B-cell maturation and proliferation, and fibroblast growth factor activity. IL-1 proteins are involved in the inflammatory response, being identified as endogenous pyrogens, and are

reported to stimulate the release of prostaglandin and collagenase from synovial cells.

Sequence similarities Belongs to the IL-1 family.

Domain The similarity among the IL-1 precursors suggests that the amino ends of these proteins serve

some as yet undefined function.

Cellular localization Secreted. The lack of a specific hydrophobic segment in the precursor sequence suggests that IL-

1 is released by damaged cells or is secreted by a mechanism differing from that used for other

secretory proteins.
