Relevance
Sendai virus is an RNA paramyxovirus parainfluenza type 1 virus that is primarily a disease of young mice; however, it can and does affect several species of small rodents. Sendai virus is immunosuppressive and can have an immediate, as well as a long term effect, on the rodent’s immune system. The virus causes high morbidity and mortality rates when combined with bacterial pathogens such as mycoplasma pulmonis and CAR (cilia associated respiratory) bacillus.
